MECHANICAL *or Natural* VENTILATION!

Suitable for flat, sloping or ridge fixing, this 'Lowline' version of the Greenwood-Airvac 'Mechavent' provides a neat and close-fitting unobtrusive roof ventilator. The 'Lowline' is built to withstand the rigours of any climate in the world and to continue to give unfailing performance. This is one of the many Greenwood-Airvac Ventilators for all purposes. Fully detailed literature on request.

TECHNICAL FEATURES

Lower in overall height than orthodox roof-mounted extractors. Constructed of heavy gauge steel, galvanised for resistance to rust and corrosion and supplied with flat, sloping or ridge bases.

Mechanical model for controlled ventilation fitted with "large volume fan" and totally enclosed motor. Available in a wide variety of standard ratings and special duties.

VENTILATION AND FIRE PROTECTION!

with the COLT DUAL PURPOSE FIRE VENTILATOR

at AC-Delco, Division of General Motors Ltd., Southampton.

A study of industrial fires in Great Britain and in America has shown that the primary cause for the spread of fire is the super-heated air, smoke and explosive gases trapped under the roof. They build up in heat and intensity from the fire below and cause flash fires. Furthermore, the smoke rapidly extends downwards, entirely filling the premises and preventing the work of the fire fighters.

Colt have successfully solved this problem with the design of the Dual Purpose Fire Ventilator which provides ventilation during normal conditions and—in the event of fire—functions as a heat and smoke exhaust.

The installation of heat and smoke exhausts is standard practice in America and is rapidly being adopted by leading industrialists in the United Kingdom. Already, 1,290 Colt Dual Purpose Fire Ventilators have been installed in General Motors buildings in this country.

Write to Dept. L.9/6B for paper "Some Aspects of Fire Prevention in Industrial Buildings" by M. J. Reaney, which deals fully with this matter.

The insets illustrate the action of the ventilator as a Heat and Smoke Exhaust. In the event of fire, the fusible link fuses, providing Automatic Escape for Super-Heated Air and Smoke.

Nature's Protection

A lucky fellow is the Armadillo. Mother Nature, with the aid of hundreds of overlapping scales, has given him complete protection against all his enemies.

Man has discovered that overlapping scales of zinc can give steel complete protection against rust and corrosion. That is the underlying principle of the Zinc Metallisation Process used for rustproofing

Beacon Windows. By means of a special oxy-propane flame gun, minute particles of pure zinc are deposited on the window surfaces after they have been subjected to intensive shot-blasting to remove scale, grease and dirt.

These zinc particles overlap—like the scales of the armadillo—and merge together to form an overcoat sufficiently thick to give every Beacon Window lifelong protection against Rust and Corrosion even under the worst possible climatic conditions.

Corrugated 'Perspex' roof lighting installed in the works of M. & C. Switchgear Ltd., Kirkintilloch. Photographs by arrangement with Newton, Robertson & Co. Ltd., Glasgow.

Two words that mean the best roof lighting— **Corrugated 'Perspex'**

CORRUGATED 'PERSPEX' is the answer in all buildings, large and small, where good light conditions are important. Corrugated 'Perspex' acrylic sheet is tough, durable, and gives a very high transmission of daylight. It means good health, good morale and increased efficiency in factories and workshops—as well as reduced lighting costs.

Corrugated 'Perspex' is light, easy to handle and inexpensive to install. It will stand up to weather conditions in any part of the world. It is available in a wide range of

profiles. It is not harmed by the corrosive atmospheres in industrial areas.

If diffused daylight is desired, Opal Corrugated 'Perspex' is available. Originally developed for intense light conditions overseas, Opal Corrugated 'Perspex' diffuses daylight evenly and efficiently.

It's as clear as daylight—it must be

The NEW Alkyd

Wall Paint of

Outstanding

OPACITY

LUXOL Flat is the modern paint for modern purposes—the supreme specification for Schools, Banks, Offices, Cinemas, Stores, and Hotels. And a boon to the small decorator—his sharpest weapon for slashing costs and fighting any kind of competition. 20 contemporary shades—all intermixable for many additional shades—plus black and white.

A test will convince you that LUXOL Flat stands up to all the claims we have made for it. Samples available on request.

Here is the complete answer to the problem of rising costs—LUXOL Flat Wall Paint.

These are the forceful reasons why LUXOL Flat reduces initial costs *and* maintenance costs:—

- 1** **Amazing opacity.** The obliteration achieved with LUXOL Flat supersedes anything previously available in this country and the opacity is such that one coat covers *any* colour on a previously painted surface.
- 2** **Ease and rapidity of application.** LUXOL Flat can be applied as rapidly as emulsion paint. It brushes on easily and is ideal for spraying. It has excellent wet edge properties; is touch dry in 4 to 6 hours, hard dry overnight.
- 3** **Dirt Resistance.** The special, attractive 'low degree' sheen of LUXOL Flat is extremely resistant to dirt accumulation.
- 4** **Washability.** LUXOL Flat wears well and washes like brand new.

ARCHITECTURAL METALWORK

Craftsmanship

Alec F. French & Partners, Chartered Architects, Plymouth

The bronze balustrade, windows, columns, breast panels and fascia, which form part of the Plymouth and South Devon Trustee Savings Bank are typical examples of the fine craftsmanship being produced by Gardiner of Bristol. The details of the Architect's design are faithfully interpreted by the experienced hands of their many craftsmen—some of whom have been with the Company for over forty years—and architectural metalwork entrusted to them will receive the care it deserves. If you are interested in genuine craftsmanship in Architectural Metalwork, contact our Technical Advisory Department — their experience is at your disposal, do not hesitate to use it.

Demountable Fibreboard and Fibre Acoustic Panels

These panels are 4' x 2' and can be used either as an ordinary fibreboard ceiling or as a fibre acoustic ceiling. In both cases the ceiling is demountable.

Fibreboard and fibre acoustic board can be arranged in patterns where a completely perforated ceiling would give too much sound absorption. A vee groove across the centre of the fibreboard would give the ceiling an appearance of 2' x 2' squares.

Below is an example of the large tile fibreboard ceiling showing how effective it can be when interspersed with suitable lighting.

OTHER MATERIALS

There are many other treatments which can be used in dealing with acoustics and our booklet entitled "Buildings should be seen and not heard" is available on request.

It deals with many aspects of noise and sound control, and illustrates some of the ways in which John Dale Engineers have dealt with them.

What am I looking for in Emergency Lighting?

More help a bit earlier on!

SAYS THE ARCHITECT

The earlier the better! The right time to start planning emergency lighting installation is early on in the planning of any building likely to need it. And that is the time we'd choose, ourselves, for giving a helping hand: which is something we gladly do for any architect and—to cast modesty to the winds—are well qualified to do. There are more than 5,500 of our Keepalite units in service up and down the country, and we helped in the installation planning of most of them. You probably know our Keepalite emergency lighting system. Automatic in action—and automatically trickle charged at all other times. Can even be said to plan its own installation—if you ask us for the advisory services of our electrical engineers!

WARM AIR HEATING

—ventilates as it heats!

St. Luke's Church, Cork, Eire.

NO UNSIGHTLY PIPES OR RADIATORS

The Grundy Warm Air Heating system gives effective and good distribution of heat without unsightly pipes or radiators. Inconspicuous but efficient, it is especially suitable for churches and similar buildings where harmony with surroundings is necessary. Adaptable to any fuel, it is inexpensive to maintain and easy to operate. For a warm, pleasant atmosphere at an economic price there is no better heating system. The advice of our Technical Department is at your disposal.

No water pipes—No damage in frost.

★ Send now for your copy of our new fully-illustrated booklet giving full details of the operation of the Grundy Warm Air Heating System.

SKYPORT ONE

THE SUB-DECK AND PUBLIC RESTAURANT

SKYPORT ONE is a *Glass Age Development Committee project. It has been designed by James Dartford, A.R.I.B.A., as an example of the city-centre air station which will be needed in the year 2000. These drawings describe a purely imaginary building which would occupy a site at St. George's Circus, London, but they are also intended as basic plans for a standard type of Skyport, which, with local variations—especially in regard to height—would serve any large centre of population. In essence SKYPORT ONE consists of a 500 ft. high landing-deck supported by three shafts which in this example straddle a 200 ft. high triple-wing building.

The sub-deck accommodates all the services and amenities which are necessary for the safe operation of scheduled air flights and for the comfort of the passengers. These are concentrated under two of the pads. Under the third, and separated from the passenger and the administration areas, is the public restaurant. This is in the form of three tiered circular platforms, the lower two revolving slowly to give constantly changing panoramic views over London through large triangular windows. These windows make up one third of the facets of the pyramidal coffering which forms the under surface of the sub-deck. The remainder of the coffering is superimposed with a large vitreous mosaic pattern. Upward views are also afforded through the peripheral skylights set in the flight deck above.

*The Glass Age Development Committee is convened by Pilkington Brothers, Ltd., and consists of G. A. Jellicoe, F.R.I.B.A., Edward Mills, F.R.I.B.A., and Ove Arup and Partners.

The Bankers' Dilemma

WHEN the Metropolitan & Suburban Bank decided to open a branch in Harvenage New Town, they were confronted with a grave architectural dilemma.

A normal Met. & Sub. branch office, with its Grecian pillars, rusticated stonework and brass-studded doors epitomizing security, was out of the question. And what sort of bank could be built with plain yellow bricks and armoured glass?

The result, something between an exhibition stand and a welfare centre, was surprisingly effective. The Man from Chubb, consulted at the blue-print stage about strongrooms, safes, and fire-resisting equipment, had the idea of making the strongroom door visible from the street.

"A more up-to-date symbol of strength than stone pillars," he said, "and stronger, too."

And so it was. The one professional burglar who had moved to Harvenage for easy pickings took a quick look and caught the next train for London.

"These Chubb people are getting in everywhere," he was heard to say. "It's downright dishonest."

There are many ways in which these Chubb people can co-operate with architects, at every stage of planning. But for a start, you should certainly have the Chubb catalogue. It details the simpler, but equally burglar-daunting, equipment which you might need any day. Write or telephone for your copy to Chubb & Son's Lock and Safe Co. Ltd., 175-176 Tottenham Court Road, London, W.1. (MUSEum 5822).

DON'T LEAVE IT TO CHANCE—LEAVE IT TO CHUBB

COLT *Canadian Cedar Wood* SHINGLES

Southern Grammar School for Boys, Baffins, Portsmouth.
City Architect, Frank Mellor, F.R.I.B.A.

NEW STYLE WALLS with an old and well tried method. Weathering to a pleasant silver grey, Shingles are a most attractive method of providing a distinctive elevation. Nailed to battens on brick, breeze or timber studding, the construction is most economical and is completely weatherproof.

The high thermal insulation of Western Red Cedar makes Shingles a valuable addition to the Architect's vocabulary of modern cladding materials.

CITIZENSHIP

The provision of adequate fire protection in buildings is good citizenship. Acknowledging human fallibility it takes the sensible long term view in preventing possible loss of life and destruction of property.

The provision of adequate thermal insulation in a building and ensuring warmth without wastage of fuel is also good citizenship. In the long term it helps the national economy and rewards the owners of the property with sensibly reduced overheads.

For this reason it should be remembered that Insulating Gypsum Plasterboard not only gives real protection from the spread of fire but, in addition, superior thermal insulation.

There is no better or more inexpensive method of ensuring two such worthwhile ends.

Insulating GYPSUM Plasterboard is BRITISH and...

The growing need for power

As Britain's industrial efficiency increases, so does the need for power. The demand for power doubles every ten years; supplies of home-produced coal do not keep pace with these developments. Nuclear energy will do much to make up the discrepancy between the demands for electric power and the available coal supplies.

Central Electricity Authority has placed contracts for two nuclear power stations, sited at Berkeley in Gloucestershire, and Bradwell in Essex. Negotiations are proceeding for a third station which, subject to consent, will be erected at Hinkley Point near Bridgwater in Somerset. These three stations will have an aggregate capacity of some 850,000 kilowatts.

The Government's revised nuclear power station programme provides for 19 nuclear power stations to be completed by 1965. They will develop from 5,000 to 6,000 megawatts of capacity and add to the national power resources the equivalent of some 18 million tons of coal a year.

As the demand for power grows, nuclear energy will become more and more important as a source of electric power, upon which the economic future of the country so largely depends.

Lion Fire Escape Stairs are made for strength and safety. Available either straight or spiral, they are constructed in steel with cast iron perforated treads and landings. For over 60 years Lion Foundry Co. Ltd. have been supplying and erecting fire-escape stairs for Government Buildings, Local Authorities, Hospitals, Office Blocks, Theatres, etc.

FLOORS for the future . . . by HOLLIS

*"A substitute shines brightly as a king
Until a king be by"*

Merchant of Venice, Act V

As in the past so in the future—WOOD is the supreme flooring material. Man-made substitutes come and go but each succeeding year brings further evidence of the inexorable return to the traditional HARDWOOD for floors. Many excellent hardwoods are now available at moderate cost which combine BEAUTY, DURABILITY and COMFORT with ECONOMY.

SPECIFY—MADE IN ENGLAND

to ensure precision in manufacture, controlled moisture content and stability of the floor.

WHAT'S NEW ABOUT THIS PIPE? A great deal but chiefly its method of production. It has been spun into its present shape by a revolutionary machine which makes use of centrifugal force. This ensures greater metal density and even wall-thickness. After examination for flaws, the bore is reamed to give the smooth interior finish which is characteristic of the FF spun pipe. THE SINGLE EAR. The FF Spun Pipe incorporates the Single Ear, (Patent Pending), which is out of sight when fixed, and

therefore can be used in place of either eared or uncared traditional pipes—halving stock commitments.

For architects who are looking for a pipe that is in line with contemporary developments in building design—for builders' merchants who are looking for strength and permanence in their plumbing—for all these, Federated Foundries have designed their Spun Soil Pipes. These comply with the new British Standard agreed by the British Standards Institution (416).

**The NEW
unit heater**

Patent and Registered Design applied for

— with higher output,
(more B.T.U.'s for your money.)

The most advanced unit heater on the market, the Biddle "Uniflow" introduces an entirely new conception in styling and embodies a heating element revolutionary in design and performance. The "Uniflow" casing with its attractive streamlining, harmonizes with contemporary buildings yet lends itself to large scale production methods with resultant benefits to the user in terms of cost and delivery.

The "Uniflow" heating coil is new, and gives a greater output than a conventional coil of the same size, whilst retaining those features of Biddle coil construction tried and proved over so many years in so many applications of heat exchangers.

MANY USERS are satisfied at a glance that the Plateswitch is the design of their choice—the careful styling and detailed finish point instantly to its special distinction. Others, probing deeper, find that the Plateswitch has been designed for easy fixing under all conditions—an important feature when final costs are reckoned. The plaster-depth or deeper boxes have the facility for quick adjustment to counter errors in squaring up, and also automatically insulate the fixing-screws. Here is a switch you can fit and forget, confident in the usual MK standards of trouble-free performance.

SEABOARD FIR PLYWOOD

Shown in the act of being removed is a large, convex form of Canadian fir plywood used to mould the "thin shell" concrete roof at the new Cadbury factory* in Cheshire. Use of the big, 32-square foot, waterproof-bonded panels results in smooth, ridge-free concrete surfaces, with important savings in time and labour . . . one of the many ways British builders are taking advantage of lower cost Canadian fir plywood. Other

in Action

uses for the strong, split-proof panels are: roof decking, floor underlay, laminated trusses and beams, hoardings and contractors' huts.

Seaboard Canadian fir plywood is readily available throughout the country.

Standard Sizes:—8 x 4 feet (Lengths over 8 feet available on order). Thicknesses (depending on grade):— $\frac{1}{4}$, $\frac{5}{16}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ inches.

SPANNED WITH LAMINATED TIMBER

STRUCTURE. The great strength of wood and its durable, non-corrosive properties have made it historically the most preferred building material. In removing the limitations of size by transforming it with modern adhesives into any desired shape and size wood has become the perfect structural material.

SCOPE. Kingston glued laminated timber arches, beams and other structural forms offer limitless scope to the architect, engineer and builder, combining strength, permanence, and dimensional stability with a high strength to weight ratio and the greatest possible slenderness and grace.

OUR SERVICE. The Laminated Timber Structures Division of our Company offers consultative assistance in the design of arches, beams and trusses of limitless spans, skilled production, speedy delivery and expert erection. Please send for full details of our Service.

The examples show some of the limitless structural forms which are available using this technique

GYPROC have a method

for erecting plasterboard suspended

ceilings and wall linings

that is simple and adaptable

The

GYPSTELE

system

The many advantages of the GYPSTELE System can be summarised in six main features. 1. Lightweight "dry" construction. 2. Simplicity of erection. 3. Fire protection. Class 1, flame spread. 4. Improved thermal insulation. 5. Increased light reflection. 6. Completely adaptable to individual requirements. The system is worth studying in all its aspects, particularly for use in factories, offices, schools and hospitals.

Write for Information Sheets A22.E1 and A22.E2 for full information.

GS.1

SPRAYED-ON INSULATION

SOLVES MANY PROBLEMS

Main Advantages are . . .

- Combines thermal insulation and sound absorption in one material
- Allows intimate surface contact irrespective of shape or protrusions
- Provides rot and vermin proof asbestos coating which will withstand vibration
- Prevents condensation and consequent corrosion on steel surfaces

SPRAYED 'LIMPET' (Regd.) ASBESTOS was created to provide a form of thermal and sound insulation with many desirable features in one single operation. The process itself consists of the application, by means of a spray gun, of specially prepared forms of asbestos fibre which are discharged from

the main nozzle of the spray gun simultaneously with a spray of water. These thoroughly intermix on leaving the spray gun and firmly adhere to the surface being treated. Irrespective of the shape of the surface, Sprayed 'Limpet' Asbestos completely covers all joints, rivets, or protrusions in one continuous jointless coating, thus eliminating all air spaces with their accompanying disadvantages.

The nature of Sprayed 'Limpet' Asbestos coatings varies with the job in hand, but in all cases it is rot and vermin proof, will not be affected by vibration and for most applications is extremely light in weight. This is the ideal method of combining thermal insulation with sound absorption and admirably suits the needs of various types of auditoria, as well as for the reduction of noise levels in factories, offices and workshops. Full details are contained in our catalogue "Sprayed 'Limpet' Asbestos Insulation", sent on request.

CORROSION TEST

The photograph on the right shows the complete protection offered by Sprayed 'Limpet' Asbestos against corrosion. Both channels were subjected to the same conditions, the test being carried out in a dyeworks.

BIG NOISE REDUCTION

Sprayed 'Limpet' Asbestos has been used in this modern cotton weaving shed to reduce noise and for anti-condensation purposes. Photograph by courtesy of Richard Haworth & Co. Ltd., Hindley Green.

Waterbury

Automatically

means warm air

Waterbury warm air furnaces are manufactured to the high standards of all Biddle Group products and are supported by the experience of an international organisation which has manufactured warm air furnaces for fifty years. There are four main styles of furnace, each with its own range of sizes—"The Hiboy", "The Downflo", "The B.300 Series" and "The Dantomatic".

Sturdily constructed, smart and built for long life, Waterbury furnaces bring the advantages of modern automatic warm air heating to almost any type of building—factories, stores, offices, shops, churches, schools and houses.

As manufacturers, Waterbury Limited, do not install warm air heating systems, but will gladly advise on the application and design of installations at any time.

When you recommend Duramel

you recommend good appearance . . .
easy installation . . . long life . . .
saving in material and labour costs

'DURAMEL'—plastic-surfaced plywood, made exclusively by HILLS—is the ideal modern construction board, combining the virtues of plywood and plastic in one material. Perfect also for all surfaces, horizontal and vertical. Architects and Builders everywhere are proving the manifold advantages of using 'DURAMEL' wherever good looks, hard wear and ease of maintenance are desired.

Installation is quick, clean and easy. One material only . . . no adhesive. 'DURAMEL' does the job quicker, costs less.

Very strong and long-lasting, 'DURAMEL' does not chip or mark, resists heat and acid, will not absorb moisture. Its appearance always gives satisfaction . . . the gleaming, decorative surface is linen-patterned and comes in 5 attractive pastel

shades. Another popular feature . . . the 'DURAMEL' surface is hygienic, will not collect or harbour germs, wipes clean instantly with a damp cloth. Ideal for use in hospitals, hotels, restaurants, etc.

AVAILABLE IN 3 THICKNESSES: $\frac{1}{4}$ " $\frac{1}{2}$ " $\frac{3}{4}$ "

In handy panels of 4' x 2' and 3' x 2', or standard panels size: 8' x 4', 7' x 4', 6' x 4'. Sold through Merchants and Distributors throughout the United Kingdom.

GALVAFROID

REGD.

the modern method of rust proofing

APPLIED LIKE PAINT

IT GIVES PROTECTION COMPARABLE WITH THAT
PROVIDED BY HOT-DIP GALVANISING

Of all protective treatments and paints developed to combat rust havoc, metallic zinc coatings have long been recognised as the best under most conditions. Until the advent of zinc-rich paints it had been impossible to apply such coatings except by specialised heat treatments such as hot-dip galvanising, sherardizing and zinc spraying. Such treatments are limited in practice because they require specialised plant, equipment and labour. GALVAFROID is not subject to these limitations and can be applied as simply as a paint to site steelwork and for the maintenance of iron and steel plant and equipment.

GALVAFROID once applied, dries quickly with a concentration of 92-95% metallic zinc in the dry film. It can be applied successfully over adherent rust and on wet surfaces and is touch dry in 30 minutes.

GALVAFROID confers electro-chemical (i.e. cathodic) protection, which prevents side-ways spread of rust under the coating should the coating be mechanically damaged by abrasion, etc. It can be left as a self-finish but in very severe corrosive conditions the best results are obtained with GALVAFROID in conjunction with a non-saponifiable paint finish.

Typical applications:

STRUCTURAL STEELWORK
STEEL WINDOW FRAMES
STEEL STAIRCASES
CORRUGATED IRON SHEETS
GUTTERS AND DOWNPIPES
CARS AND COMMERCIAL VEHICLES

The test plates shown in the photographs have been damaged by deep diagonal scratches before 28 days exposure to the accelerated corrosion test in accordance with B.S. 1391 (SO₂ test).

- 1 Two coats of red lead paint
- 2 Two coats of GALVAFROID
- 3 Primed two coats of red lead and finished with two coats of a chlorinated rubber paint
- 4 Primed with GALVAFROID and finished with two coats of the same chlorinated rubber paint

Putting the old with the new

Old style heating surface, with its network of pipes requiring valuable wall and floor space, gives the same effect to modern buildings as old style wheels on a 1957 car. They are out of place and certainly don't measure up to the efficiency of the latest developments.

Progressive architects believe in modern equipment for modern buildings, and enthusiastically accept the scope offered by Frenger, THE heated and acoustic ceiling.

Frenger radiates heat to fulfil the most exacting conditions for comfort in working spaces. It has a clean appearance and a healthy effect. Takes no floor or wall space. Gives an uninterrupted ceiling plane. Provides a perfect void for conduits, pipes, valves, duct work, etc., with flexibility for the introduction of lighting fittings in positions required, both recessed and pendant type. Each panel, being easily removed, is its own access to the ceiling void.

Write now to the Frenger Technical Sales Department for full particulars.

The Technical Service Laboratories at Egham, Surrey, of Shell Chemical Company Ltd.

SENSATIONAL DISPLAY LIGHTING IMPROVEMENT

from this

to this

in 10 seconds

with the

RIVLITE

Contemporary

LIGHT CORRECTION FLITER and LOUVRE

(Regd. design and Patent applied for)

There is a sameness about shop display lighting which hitherto it has not been possible to overcome without considerable expense. Now, with the introduction of the RIVLITE Contemporary Light Correction Filter and Louvre, the appearance and effectiveness of recessed shop window reflectors may be improved out of all knowledge.

WHAT IS THE RIVLITE?

The RIVLITE is an entirely new idea, a simple unit which may be securely clipped into position on the reflector in ten seconds without even the need of switching off the lights, so that full lighting efficiency may be maintained whilst this improvement is being made. The fitting can be made by anybody and an electrician is not needed as the installation is not touched in any way. The Rivlite fits almost flush to the ceiling and is available in white and colours.

WHAT THE RIVLITE ACHIEVES!

Firstly, with the Rivlite, the lights themselves are 100 per cent. better

looking and the full lighting efficiency is maintained. The concentric circles of the Rivlite filter transform the appearance of the ordinary reflector into a smart contemporary finished unit. Secondly, the Rivlite kills dazzle, yet none of the brilliance is lost. Coloured lighting also benefits from the use of the Rivlite, as more true colour is obtained due to the correction of the reflections. Displays are often spoilt by lamps falling from reflectors and shattering in the merchandise, this cannot happen with the Rivlite as the lamp is held behind the fitting.

The Rivlite is now being used and has been installed by a number of multiple concerns.

THE RIVLITE IS INEXPENSIVE

It is permanent, there's nothing to go wrong or deteriorate. It is impervious to the heat of the lamp, non-static and easily cleaned. Your first cost is your last cost—but it's a very small outlay for the considerable advantages obtained. Further details will be gladly supplied on request.

J. RIVLIN Ltd., 17 BRUNSWICK STREET, LEEDS, 2. Tel. 31458/9

C.A.A.

It's a pleasure getting into -

Hot Water

Your customers can *submerge* their troubles in the comfort of hot water wherever and whenever required, with the knowledge that it is provided in the most economical and efficient way. That's why people are saying the nicest things about the Heatrae F.B. - the complete hot water system in itself.

The F.B. is a multi-point, cistern type, automatically controlled Electric Water Heater. Available in sizes up to 30 gallons capacity. Ideally suited for fitting in blocks of flats.

NEW! ALLIED IRONFOUNDERS

Vogue a low-priced bath with real glamour

British Regd. Design No. 879397

THESE ALLIED VOGUE FEATURES WILL CATCH YOUR CUSTOMER'S EYE—

The attractive new shape

of the Allied Vogue—low, streamlined, ultra-modern. The bottom of this new bath is practically flat—safer for the infirm, or for taking a shower.

Taps on either corner within easy reach—

or in the usual central position, if your customer wishes. The choice of tap positions makes installation easier, too.

Gleaming chrome handgrip

at small extra cost adds the sparkle of luxury—and makes the bath safer for children or elderly people. It's also a useful support when cleaning the bath.

Neat toe recess.

A matching porcelain enamelled cast iron panel can be supplied as an optional extra. This panel is recessed to give comfortable toe-room when bathing the children or cleaning the bath.

Choice of lovely colours—

the Allied Vogue is available in all usual shades of hard-wearing, easy-to-clean Duramel.

And the low price will win them over!
Allied Vogue costs no more than the Magna bath!

For further details

No. 3252 Vol. 125 June 27, 1957

9-13 Queen Anne's Gate, London, S.W.1. Tel. WHI 0611

Subscription rates: by post in the U.K. or abroad, £2 10s. 0d. per annum. Single copies, 1s.; post free, 1s. 3d. Special numbers are included in Subscriptions: single copies, 2s.; post free, 2s. 3d. Back numbers more than 12 months old (when available), double price. Half-yearly volumes can be bound complete with index in cloth cases for 30s.; carriage, 1s. extra.

AIA CENTENNIAL CONVENTION

2. *The Laymen*

Assuming that there should be some serious talk between martinis, who does one ask to address an architects' convention? Since no organizing committee may be expected to be brave enough to make a selection from local architects' ranks, the usual alternatives are distinguished foreign architects or distinguished local laymen. And since all the former are likely to be Americans anyway, one may as well concentrate on the latter. The AIA did. With the exception of Mr. Leon Chatelain, Jr., the President, at the beginning, and Dean Pietro Bel-luschi at the end, architects kept out of the public discussions. The huge Sheraton Hall's platform was decorated mainly with publishers, scientists, ferns, politicians, musicians, an actress, red and yellow imitation gladioli, and a sculptor.

Confronted with some 4,000 eager up-turned architectural faces, the laymen reacted differently. Some felt compelled to colour their customary subjects with references to buildings. Thus Dr. D. W. Bronk, President of the National Academy of Sciences, after explaining that his confrères "have now achieved the power of pouring into the atmosphere pollution . . . which can destroy the very life of man," remarked that here was a challenge to his audience. Architects, he suggested, should be mulling over ideas for making radiation-proof houses for all. Mr. Edward Weeks, editor of the *Atlantic*, made his "keynote" address, *A New Century Beckons*, an attack on small-house developments. Everyone applauded loudly, for no one present felt responsible for them. The actress, who was Lillian Gish, attacked bulldozer develop-

VERNON WORKS, OLDHAM

LONDON OFFICE:

167, OXFORD STREET, LONDON, W.1

Trustees for Civic Design

This colonnade (1765) from the garden of the rococo gothic Arno's Court, next to a trolley-bus depot in a squalid stretch of the Bath Road on the outskirts of Bristol, is to be saved from demolition to become a landscape ornament on a new site. The creative use of the old like this is one of the mainstays of Improvement—the name used in this month's *Architectural Review* to describe the policy of the newly established Counter-Attack Bureau. This has been formed as a result of the flood of requests for help that have come in to the *Review* as a result of their attack on Subtopia. The Bureau provides advice and publicity to all who want or need it. It obtains expert opinion or pulls what strings are at its disposal to preserve or enhance and, above all, *improve* the character of places. The JOURNAL hopes that readers who learn of existing, proposed, or suspected out-

rages will write to: Counter-Attack, 9, Queen Anne's Gate, S.W.1. This policy is an attempt to carry on the work begun by Clough Williams-Ellis in the 1920's and the ex-Bristol colonnade (shown above, with the interior top right as it was about 1900, and as it is today) is therefore a particularly apt illustration, for the "new site" is Williams-Ellis's Portmeirion (bottom) where it will stand at the back of the lawn facing the slipway. The fact that the *Review* felt that it must set up the bureau is a measure not only of the renewed interest in spoliation in town and country—a revival very largely due to *Outrage* and *Counter Attack*—but also of the need to go further than mere preservation and make a positive contribution towards the improvement, and the enhancement, of town and country—a task to which architects are above all fitted to contribute.

ments and they were assaulted again by Dr. Paul Tillich of Harvard, who dwelt on the difference between our animal surroundings and our human environment and described the hated mutual enemy—the miserable little house—as a symbol of the modern phenomenon of loneliness in a crowd. Mr. Bennett Cerf, publisher and writer, skirted architecture and told anecdotes (e.g., the day when an address-plate jammed in the automated enveloper at Time Inc. and a lonely farmer out west received 12,600 heartrending pleas to renew his subscription to *Life*). He also told funny stories in support of People's Capitalism (e.g., the English national-health doctor who simply rubber-stamped an expectant wife's middle with a minute message: "When you can read this without a magnifying glass send your wife to the hospital") and commented that "American arts, culture and—as you people well know—architecture, are now ahead of all Europe put together." He appealed to Americans, therefore, to drop their "ridiculously apologetic" ways, for they are the fountainhead. "Now we give the people of Europe not only our dollars but our ideas."

On the whole, however, such thoughts were swamped by warm waves of internationalism. Mr. Paul G. Hoffman, US Representative at the UN General Assembly, ignored architecture altogether and spoke of the problems of international understanding—especially in regard to Asia. How wrong, he said, to talk of these as "undeveloped nations." They are young nations coming up quickly and we can hardly expect them to understand us if we don't first try to understand them. Several foreign delegates presented illuminated addresses to the AIA and the Danes added a gold medal. They mentioned how much they admired American architects, especially Frank Lloyd Wright, absent, to whom they had given a similar medal the day before, all for himself. Several times Churchill was quoted. "We shape our buildings; then they shape us," came out two or three times and Dr. Bronk reminded us of the immortal line, as he put it: "There are so many who owe so much to so little." The laymen carried the convention well, and so politely. No suggestion was made that architects had any problems left to solve. Mr. Henry R. Luce, speaking in anything but *Time*-style, apparently saw no fault in the future which a few architects couldn't cure. The unofficial theme of the meeting was: "Give me enough architects and I will give you Utopia." Have laymen lost their punch?

COST ANALYSIS—THE NEXT STEPS

ON page 949, we print the last two of the lecture-discussions organized by the JOURNAL and the Regent Street Polytechnic School of Architecture. Over the past year we have known that an increasing number of architects, surveyors (and builders) were becoming interested in cost analysis, and it was this that prompted the idea of holding such a course. But the number of enrolments, 350, took us by surprise. Such a widespread response, and certain leading problems thrown up during the course, clearly point the direction for the next step:

First, that there is a need for the yet more intensive publication and exchange of cost information and second, that the preparation of analyses should be, so far as possible, on an even more uniform basis, so that they are more useful and more easily comparable one with another. Present JOURNAL analyses do not conform with strict definitions, owing to differences of interpretation on the part of quantity surveyors. But this has not really mattered, for our purpose in publishing them has been to encourage people to prepare their own and accumulate the experience necessary before the technique can begin to be crystallized in a form which is generally agreed. To meet the needs thrown up by the course, we issued, at the last meeting, two invitations. One was to those with experience of cost analysis and cost planning to form a small study group with the purpose of reviewing the lists of elements and the definitions of elements now in use, in order to produce some (provisionally) standardized form which all architects and quantity surveyors may use so that their work is co-ordinated. The second invitation was to those who have no experience, but intend, perhaps as a result of the course, to prepare and use analyses. We asked them to give us their names and addresses to enable us to pass on to them the findings of the study group; and to help them where we can, with advice. We also propose to publish the analyses they prepare. By these means, we hope to improve the usefulness and increase the number of analyses published. We extend this latter invitation to readers who were not at the course.

One other step forward was announced at the last meeting. Michael Austin Smith told the gathering that the Council of the Architectural Association has just formed a "costs" com-

mittee. Terms of reference have yet to be formulated, but they will no doubt include the possibilities of the collection and exchange of cost information. This very encouraging news means that there are now five separate bodies with similar interests—the Cost Research Committees of the RIBA, the RICS and the AA; BRS and the JOURNAL. We have told them of our proposal and we are confident that close co-operation between us will secure uniformity in the presentation of cost data.

To conclude, we wish to thank all those who contributed to the success of the course, to the lecturers, to the chairmen and not least to the principal and staff of the Regent Street Polytechnic School for their wholehearted support and co-operation.

PROFESSOR OF BUILDING SCIENCE

The University of Liverpool's announcement on another page that it has established a Chair of Building Science and appointed its first tenant must be given a great welcome by the Industry and all the associated professions, for clearly it is a step in a sound direction.

We must be forgiven some qualification at this point, however. The step is worth while and it has no doubt demanded a great effort from those who took it; but relative to the potential field of activity it is pitifully small. It is not a Chair of *Building* which would have a single, relatively clear-cut field with which to deal. It is not limited to architecture, for it is linked to the faculties of Science and Engineering as well. It is presumably nothing less, therefore, than an appointment to organize education in the relevant sciences and technology for architects, for the associated professions, and for people wishing to enter the manufacturing or the assembling side of the Industry. And then, of course, there are both the undergraduate and the post-graduate aspects to cover, with the latter's special emphasis on scientific method and research. The field is therefore vast, and presumably too large to tackle all at once. Different kinds of courses and different degrees of specialization are needed in different combinations. Architects require some elements of almost all the branches—physical, chemical, sociological, economic, structural and others—brought together and focused upon design. Engineering professions have each a narrower front and much greater depth of penetration. The Industry calls for yet another balance of breadth and depth. The question facing the new Professor must be “where and how to begin”? Perhaps we can hope that, from among the contending interests, architects will have an early call upon his help, for it is no particular secret that they first brought the value of such a Chair into focus, and not only is their need urgent and substantial, but their drawing boards are now perhaps the most productive point to touch in the building cycle. Buildings begin here, and it is here that the main decisions affecting efficiency and economy are taken.

The new Professor will have the best wishes of architects as he takes up his appointment.

NO SENSE ON PROPORTION

The margin by which the motion in favour of proportional systems was lost at the RIBA's debate last week was sixty-odd to forty-eight with a great number of abstentions—enough abstentions, in fact, to reinforce ASTRAGAL's suspicion that proportional systems are a dead issue again. The debate was not such as to force people to take sides, anyhow. Professor Pevsner set things going at a terrific pace with his lightning historical survey “from Genesis to the Modulor in fifteen minutes,” but once this launching-boost had been expended, the rest of the stages of the rocket only fizzled, so to speak, and the debate was soon off-course and cruising at half-power. Peter Smithson, the last platform speaker, sounded more business-like than his immediate predecessors, but the debate was already beyond salvation.

*

There were authoritative interjections from the floor, by Professor Wittkower, who started the post-war craze for proportional systems, and from John Summerson. The former embarrassed Modulor-fanciers by quoting Corb himself as saying, “Le Modulor, je m'en fêche,” and Summerson embarrassed Corb-fanciers by drawing a parallel with Lutyens, and saying that it was a problem in psychology, basically, that men of such powers of invention as

Corb and Lutyens should feel compelled to fool around with private systems of proportion. Rather more of this sort of contribution, and rather less metaphysical flannel about "The essence of a work of art is unity" and "A square is always a square," might have helped the debate along quite a bit.

*

Another way to have made this debate livelier would have been to hold it about five years ago, of course, when people really cared about proportion.

SUMMER VISITORS

The presence of Professor Wittkower amongst us has already been noted in this column, but he is neither the first nor the only summer migrant of importance to touch our shores. Professor Hitchcock has arrived with the inevitability of the passing seasons, but may already have passed on to hotter and more romantic climes by the time you read this. Rumour has it that he has been putting the finishing touches on his long-awaited *Pelican* history.

*

An even more welcome visitation was from Marcus Whiffen, late of the *Architectural Review*, and currently established in Colonial Williamsburg, where he has been writing what should be the definitive account of the restored Virginian capital's public buildings. It appears, however, that he hasn't had his nose to this particular grindstone all the time he has been in Virginia, for a recent issue of the *Journal* of the (American) Society of Architectural Historians contains some rather Whiffenish observations on the planning of some Virginia country houses—Whiffenish, particularly, in contrast to the usual contorted and over-footnoted style of US historical writing, by virtue of an easy familiarity with books and buildings from all over the place, and by virtue of an off-hand reference to colonial Virginia as a "backwater"—who else could say that in Virginia and live to tell the tale?

LET THERE BE LIGHT

The York Institute of Architectural Study, that active little organization that is rapidly making its weight felt in the north and elsewhere, looks like pulling off something new and pretty good

early this autumn. Dr. Singleton, who is its Director, has got together a team to do a special course on light and colour, and it looks like a rather special team too. He has got Allen, Hopkinson and Gloag from BRS, Medd from MOE, and Derek Phillips, Dykes Brown and Wilcock from the lighting industry. Between them they've largely built this subject up since the war into something that is a fundamental part of the modern architectural approach, and apparently they're going to be given a real opportunity to put it across in their own way—and even this is to be rather special—to a select few of lucky architects who can get in. They've given an opportunity to enrol, first of all, to teaching staff from the schools of architecture, and to the RIBA examiners, and obviously it is right that a concentrated effort should be made to get this material into the schools. But now the priority is off, and it is open to anyone to apply, at least up to the end of July. Here is something that's got on farther and faster here than anywhere in the world. It ought to be quite a thing to be in on it.

FOR BETTER, FOR WORSE

One point that Mr. Anthony Mealand, the City's planning officer, made on the City's and the LCC's plan for the Barbican at the Planning Forum last week deserves repeating: the City, he said, was in a "first-class position," because it not only possessed planning powers but also owned most of the land. Landownership, however, clearly does not solve all planning problems. Because the ground rents would be £6 a sq. ft. the rents of the flats planned for the Barbican will run from £300 to £500 a year. Mr. Mealand is looking for 2,000 families with £2,000 a year, and it was not surprising to hear him describe this housing scheme as "doubtful." The same problem afflicts multi-storey car parks: the City has just let a site for a 500-car park, at a rental of £12,000 a year, and the motorist is unlikely to be able to park his car in it for less than 10s. a day. The City is planning to provide parks for 10,000 cars, which would increase the number of cars coming into the City every day by 4,000. Is it not rather ludicrous to plan car parks on this scale when there is no reasonable probability that the roads will be able to cope with the traffic? Mr. Mealand himself admitted that the more parks

Just a reminder (below) that many of the usual visual amenities available to sightseers in this country are available at Blenheim Palace. A reminder, too, that the annual architects' conference, which is being held in Oxford from July 10 to 13, will hold, on Friday the 12th, a ball at the Palace—a ball which you can attend even if you are not a conference member, on payment of £2 2s. per ticket. (Apply to the Secretary, RIBA, 66, Portland Place, W.1.)

he provides the more people will bring their cars in, and the worse the problem will become.

MATRIMONIAL ARCHITECTURE

Strange goings on at Crawley have come to ASTRAGAL's notice. A Mr. J. Dean tried in vain recently to persuade the local Valuation Court to reduce the rateable value of his house in Goff's Park Road ("the best road in Crawley") from £82 to £66 on the ground that it was designed not by an architect, but by his wife. And she, Mr. Dean's lawyer admitted, "is the first to admit she made mistakes." The house was said to be "rather box-like," to have an "unattractive elevation"; the windows were "all different sizes," and the general appearance "not a good one." How is it that such an unpleasant house, as it appears to be from the description, got past the local planning committee in the first place? What on earth is the point of elevational control if it lets such things go by? It is only a minor consolation that Mr. Dean was unable to pass on to the rest of the community the cost of his mistaken economy in

allowing Mrs. Dean to try her hand at architecture.

WHAT THE EYE DOES NOT SEE

C. H. Aslin, putting on a charming-old-codger-but-young-in-heart act at the Central School diploma ceremony last week, produced, in his speech to the students, an account of what happened to the Herts art-work for schools programme, that differs somewhat from the official version.

*

Mr. Aslin said, in effect: At the beginning we had a tolerable sum to spend on works of art for schools, and we contrived to spend it in a way that seemed to please both pupils and staff. Then we got bolder and started putting up statues and things outside the schools where they could be seen from the road. That did it; persons signing themselves "Irate Ratepayer" started writing to the Education Committee about this scandalous waste of public money . . .

*

The Central School was faintly involved in the Herts Schools programme—to the extent of some mural paintings at least—and ASTRAGAL noted that both Aslin and members of the school staff seemed to think that the relationship might be revived in the pretty near future.

DOWN RIVER AND BACK

Each year the Thames barge race seems to fade just a little more, and it is now supported by five or six firms only, too often with vessels which are kept only for the race, and become more yacht-like and meaningless each year. Even the barges which have to earn their living are getting older and more tired each year, and barge profits are so small that only the rich firms can afford the loss of working time in racing them. For last week's race there was a fairly fresh north-easter and one was glad to see that the two purely racing machines were beaten, though among the working barges there were a few mishaps. Still, it was worth seeing, as always, with the usual sprinkling of architects on the Committee boat. But anyone who feels they ought to see the race once in a lifetime had better go pretty soon, for I don't think it will last much longer.

ASTRAGAL

{ H. S. Scorer, A.R.I.B.A.

The Right Price

SIR,—May I refer you to your report in THE ARCHITECTS' JOURNAL for June 20 on the lecture discussion at the Regent Street Polytechnic on Elemental Bills of Quantities, at which discussion I served as Chairman.

In my summing up I am reported to have said "We want really to get at not the cheapest price but the right price for the builder." That is quite a thought but not what I said, and for this you should substitute "building" for "builder."

I was differentiating between cost analysis and price analysis and inferring that the lowest tender price for a building does not generally coincide with its actual cost. There is I suggest a danger of inaccuracy in using a priced bill for a cost plan. True costs are historical facts.

London.

P. E. TRENCH.

"Architectural Insult"

SIR,—I would be grateful for space in your columns to ventilate what I can only describe as an architectural and educational scandal. An eighteenth century building, designed as a charity school, is being converted to a School of Art and Architecture. Despite representations, the Authorities persist in carrying out the conversion of the building without appointing an architect. (Lincoln has a City Architect, and there are six architects on the staff of the school). The architectural quality of the work can best be summarized by the enclosed photograph!

Under the Town Planning Act the building is scheduled, which means that no alterations affecting the character should take place without two months notice. This notice has not been given by the Education Authorities. From an educational point of view it seems to me fatuous that the Education Authority should give grants to students and pay staff to teach architecture and design, and then decline to appoint an architect for the building work. It might even be considered a studied insult to the architectural profession.

I hope that by ventilating the matter in your columns the Authorities may be persuaded to make a more rational decision.

Lincoln.

H. S. SCORER.

The editors write: Following the receipt of the above letter we have made some enquiries to try and establish the facts. The Leeke School, which was formerly a charity school, is being converted at a cost of £6,500 for use as a School of Art and Architecture. It is a scheduled building, but no notice of the intention to alter it has been given to the MOHLG. The chief clerk to the Director of Education says that this is unnecessary, because the alterations do not affect the "protected part of the building," apart from a new hatchway for the serving of meals. The City Architect, Mr. R. R. Alexander, says that the "protected part" is not affected at all. But the Ministry of Housing and Local Government says that the law is quite explicit: that no alteration may be made to any part of a scheduled building without two months notice being given to the local planning authority, and through it to the Ministry. The MOHLG itself has, however, sanctioned the loan for £6,500 without checking whether the building was scheduled or not.

Is an architect being employed? The chief clerk to the Director of Education says that "the City Architect was employed to do part of the work for us." The City Architect says that he was not consulted, except about certain drawings for "alterations to conveniences and that sort of thing." The principal of the Art School and members of the staff were, he says, "concerned in preliminary sketch plans." The City Architect was definitely not responsible, he says, for the design of the new door to which Mr. Scorer takes exception, and which is illustrated on this page. The Ministry of Education says that it approved the proposal to convert the Leeke School, and to do it "by direct labour under the clerk of

An elevation of the Leeke School, Lincoln, showing the crude new door which has replaced a window, and is completely out of scale and keeping with the remainder of the facade. It is complained (see letter) that no architect has been employed on the conversion of this building into a School of Art and Architecture, and that no notice has been given of the intention to alter a scheduled building.

works, and under the supervision of the City Architect." The detailed estimate, being less than £10,000, did not require its approval. From all this it does appear that the conversion as a whole was not designed and is not being supervised throughout by an architect.

RIBA

Council Election Results

The results of the election for the RIBA Council were announced on June 18. The President, Kenneth M. B. Cross, and the Past-Presidents, C. H. Aslin and A. Graham Henderson, were elected unopposed. The following were elected members of the Council (* denotes a new member).

Fellows	
Professor Basil Spence	2,023 votes
Frederick Gibberd	1,661 do
*Hubert Bennett	1,585 do
Associates	
Donald E. E. Gibson	2,631 votes
*Peter F. Shephard	2,031 do
Stirrat A. W. Johnson-Marshall	1,338 do
Licentiate	
Gwynne H. Morris	2,627 votes
Ordinary	
Professor R. J. Gardner-Medwin	1,322 votes
*Harry Durell	1,232 do
Percy E. A. Johnson-Marshall	1,199 do

The following candidates were not elected (in the order of votes received): W. E. Tatton Brown, Gontran I. Goulden, C. G. Stillman, J. H. Forshaw, Thurston M. Williams, Bryan P. Westwood, C. E. Culpin, S. E. T. Cusdin, H. J. Whitfield Lewis, Robert Mackellar, C. Max Lock, R. Llewelyn Davies, Alexander Steele, Harry Judson, Howard V. Lobb, Cecil Howitt, F. B. Pooley, C. H. Simmons, P. B. Dunham, A. Douglas Jones, Anthony Pott, S. W. Milburn, A. E. T. Matthews, H. R. E. Knight, S. E. Urwin, H. B. Allsopp, D. H. McMorran, R. F. Hutchison, P. V. E. Mauger, C. F. Bates, C. H. Bingham-Powell, Isaac Chaikin, C. F. J. Thurley, R. O. Vine, C. S. White, L. J. F. Gomme, G. W. Knight.

The representatives of the Allied Societies on the Council include the following new members: North of England: Cecil Leckenby. Midlands: E. W. Parkinson, H. A. Rolls, S. F. Barrell, Birkin Haward. South of England: A. G. Bazeley, R. F. Fairhurst, Colin Cooper, L. J. Selby. Scotland: J. A. H. Mottram, T. H. Thoms. Wales: Cyril A. Hughes. Overseas: G. R. C. Muston (New Zealand), Colin M. Sinclair (South Africa). The Architectural Association (London): John Brandon-Jones. Chairman of the RIBA Registration Committee: S. Vincent Goodman.

Two representatives of the RIBA Salaried and Official Architects' Committee, one representative from Scotland, one from

Ulster and one from India remain to be appointed. Three vice-presidents, the honorary secretary and the honorary treasurer are to be appointed by the Council on July 2.

LIVERPOOL CHAIR

Of Building Science

Professor Arnold W. Hendry who was recently appointed to the new Chair of Building Science at the University of Liverpool—the first Chair of its kind in the country—has begun the preparatory work for his new department, which will start to operate next Session. Professor Hendry is 35. For the last six years he was Dean of the Faculty of Engineering at the University College of Khartoum, where he laid the foundations for a new School of Architecture within his Faculty. His proposals for the architecture course there included a strong basic training in building science. He is well known in this country for his photo-elastic studies in the behaviour of structures, and is a Bronze Medallist of the Institution of Structural Engineers.

Liverpool's new Department will be unique in that it will be linked to three University Faculties: Arts, in which the School of Architecture is established, Engineering and Science. This is intended to promote teamwork between architects, engineers, and scientists. Professor Hendry's Department will give undergraduate instruction, directly and by co-operation with present staffs, to students of architecture and engineering; it will also accept post-graduate research students—who may be scientists, architects, engineers or builders—for higher degrees. Building economics will be linked to the more strictly technical studies, and it is hoped that there will be strong ties with the building industry and its research and development organisations.

The Liverpool School of Architecture recently founded the post-graduate degree of Master of Architecture for research of a kind which contributes to the advancement of knowledge in the practice of architecture. With the arrival of the Building Science Department, the School hopes to widen the scope of its post-graduate research and to promote development work.

GENEVA

Competition Results

The result of the competition for the redesign of the Place des Nations, Geneva, has been announced. The first prize (12,000 Swiss francs) has been awarded to Professor Andre Gutton, Paris; the second prize (10,000 frs.) to Rainer Schell, Wiesbaden; the third prize (8,000 frs.) to V. Magastretti and M. Righini, Milan; the fourth prize (6,000 frs.) to D. Hein, Munich, and the fifth (4,000 frs.) to J. Otruba, Prague. There are no British prize-winners. The designs are on exhibition at the Palais des Expositions, Geneva, until July 6.

VISUAL EDUCATION

'Let Architects Lead'

Henry Morris was unfortunately overcome by the heat when he arrived at the Housing centre to speak at the annual meeting of the Council for Visual Education last week. But in his speech, which was read for him, he laid about him with characteristic freshness and vigour, contrasting the advances made in science and in the standard of living with the disintegration of the visual environment, particularly in countries with a long tradition of humanized landscape. The great failing today, he thought, was

aesthetic, and he expressed astonishment that people of great taste in literature, scientists and other academic people were often aesthetically illiterate, or stone blind.

He contrasted, too, the success of the universities as leaders in science, with their failure as patrons of the arts and their inability to prefer the original in contemporary art. The universities dealt with the human arts as historians, critics or commentators on the past. For science the present was reality, but for art it was the past. As patron of architecture and the visual arts the universities had proved conventional, academic, imitative and backward looking.

Mr. Morris would like to see an end to metaphysical art theorising, and would banish art historians altogether. It was to the architects that he looked to maintain standards of aesthetic taste in all visual things, as an advance guard in every locality, with the local architectural societies as the trainers of local opinion, and with architectural journalists playing a similar role by recognising that "roaring is not enough."

Mr. Morris would like to see an end to for the artist to sustain human values in a world dominated by applied science and technology; and he contrasted those art forms which could be enjoyed privately with architecture, the great public art that could only be provided by society. Modern architecture, he said, was the result of new structures and principles, but modern architects must also express the significance of man's activities and give nobility to his environment and minister to his appetite for delight and beauty. It was not to be anticipated that modern architecture would fail to do this, although the task was indeed formidable.

Beauty and the aesthetic were as important as food and air, and we had to make the fostering of taste and style a first imperative in our culture, as important and necessary to man as science and scientific method. Nothing less than that would do. Architecture, landscape, colour and design should be a major part of all school life. People would say there was not enough time, but our visual environment was a priority. There was a great deal of wasted time in our secondary schools, but the golden rule in developing the visual senses was habituation (which required no place in the time-table or in examinations) not discourse or lecturing. The first instrument of habituation was the quality of the surroundings, and here Mr. Morris criticised modern school architecture for using far too much glass, and disregarding the fact that external texture and form contributed nobility to man's environment. Some architects were hag-ridden by speed, the enemy of art, and school-buildings, he urged, must be kind to schoolchildren; it was an unkindness to use school building as a medium for extreme doctrinaire experiments. School playgrounds, too, should be a demonstration of the use of beauty.

The aim of education in art was the stimulate and training of sensibility. Fortunately a great improvement had taken place in the schools: 25 years ago art was a "relief subject" for the boy exhausted by the laboratory. Now painting and art were given generous time in infant, primary and secondary modern schools. Children came under aesthetic influences they would carry forward into youth and maturity, and we could be certain of a marked advance in a generation's time. Time must be found for the inculcation of the elements of architecture, but the test of artistic training was, he suggested, the taste exhibited by men and women in their own environment, and not in talking about art. People could be scholarly in talking about art, yet have no taste in their own houses.

It was unfortunate that the modern universities had forgotten the lesson of Oxford and Cambridge, not only in providing a

corporate life, but also in providing an environment of beauty. There was a new interest at the universities in buying pictures, but pictures were not enough. Young people at the universities, and the dons too, should have a means of acquiring an appreciation of architecture, landscape and town and country planning. He would like undergraduates to be taught that architecture was "the mistress of the arts," for the proper approach to art was through architecture and town and country planning. Style, he concluded, was as important and necessary in life as science and technology, not least in the universities and places of professional training.

COMPETITION

For Jinnah's Tomb

An international competition with a first prize of Rs. 25,000 (approx. £1,875) for the construction of the Mausoleum of Qaide-Azam Mohammed Ali Jinnah at Karachi is announced by the Qaide-Azam Memorial Fund. The author of the project placed first will be employed as architect of the work. There is also a second prize of Rs. 15,000 (£1,125) and Rs. 10,000 (£750) will be at the disposal of the jury to reward

the authors of other projects. The competition is open to all architects, engineers and town planners irrespective of nationality.

The jury consists of H. S. Suhrawardy, Prime Minister of Pakistan, Prof. E. Beaudouin (France), Prof. Robert Matthew, Prof. P. L. Nervi (Italy) Gio Ponti (Italy) and Georges Candilis, rapporteurs representing the International Union of Architects.

The complete programme is available (against a deposit of 3,000 French francs or the equivalent value in local currency) from the IUA, 15 Quai Malaquais, Paris 6, to be deposited with a national section of the IUA. Questions about the programme may be sent to the IUA before July 31, and will be answered before August 31. The competition closes on October 31.

LANDSCAPE

Institute's Conference

The Institute of Landscape Architects is holding its Annual Conference in Newcastle upon Tyne on September 6, 7, and 8.

The Conference theme will be *The Landscape of Industry*.

The Conference will be held in King's College and there will be an exhibition

related to the Conference theme in the Hatton Gallery, which will be open to the public.

The speakers at the general session on "The Manufacturing and Extractive Industries" will be the Marquess of Normanby, R. E. Newell (Engineering Director, I.C.I., Wilton), D. E. Baird (Deputy Chairman of the Durham Division of the National Coal Board), and G. A. Jellicoe of the Institute of Landscape Architects.

The speakers at the general session on "Afforestation and Agricultural Landscapes" will be Sir Stephen Middleton, Bart., Lord Bolton, P. Garthwaite (Forestry Commission), and J. M. W. Adams, of the Institute of Landscape Architects.

There will also be several papers given at a professional/technical session on subjects varying from pit heap planting to the restoration of the small woodlands and tree groups of the countryside.

Visits will be made to examples of industrial landscaping in Durham and Northumberland.

The opportunity is also being taken to show the film "The Land of the Three Rivers," which will give visiting delegates an impression of the north-east region.

A full programme may be obtained from the Secretary, The Institute of Landscape Architects, 2, Guilford Place, W.1.

In the International Furniture Competition at Cantu, Italy, Nigel and Sheila Walters, of London, received an award of £130, approximately, for the design, below and right, for upholstered or cane (for outdoor use) chairs. The designer's object was to produce a system of elements capable of being arranged in a variety of traditional and novel forms, as shown. The elements were: a high-backed and a low-backed chair, a foot-rest, a low table, a head-rest, chair-arms, and a side table. The double prong at the apex of the cast brass or aluminium legs is designed to receive and support either a second chair, or a chair-arm. Construction: steel frame, with expanded metal infill covered with 2-in. foamed rubber.

CRITICISM

The architects reply

Last week we published in the JOURNAL a critical review by J. M. Richards of the housing scheme in Golden Lane, City of London, designed by Chamberlin, Powell and Bon. This week we print the architects' replies to the points made by Mr. Richards.

We are grateful to J. M. Richards for the generous tone of his article and will confine our comments to his more critical observations.

Treatment of courts: It is suggested that this may be too restless; possibly this is so, but we think it only fair to reserve judgment until the whole is complete, as Mr. Richards suggests. The courts are designed to be as different in character as they are in shape, and the community centre court which forms the focus of the estate has been most richly treated; the other three courts are detailed more plainly.

Concrete balcony fronts: We also are dissatisfied with these and the application of a finish is being considered. For cheapness and permanence exposed concrete has advantages; we hoped that it would weather uniformly—albeit dingily—and thus provide a dull matt surface in contrast to the brilliance of the glass panels but this process is taking longer than we thought.

Framework of staircases: Somewhat naturally, we do not admit that these are crude either in detail or in execution, although we appreciate Mr. Richards's feelings regarding the appearance produced by the atmospheric staining of concrete.

Curtains in the high block: We anticipated the importance of curtains to the external appearance of the high block and advised our clients to insist on uniform linings, uniform net curtains, or both; this would not inhibit choice regarding internal furnishings but would preserve unity in the external appearance. Whether this can be achieved is largely a problem of management outside our control as architects.

Roof structure on the high block: The following notes which briefly refer to our design intentions

regarding this roof structure may be of interest.

The superstructure houses a number of necessary functional elements including the cold water storage tanks, the lift motor rooms, and the estate boiler flue which we have tried to group in such a way that their form contributes both to the high block and to the estate as a whole.

In order to reduce its appearance of bulk, this block is split from top to bottom down the north and south ends by the deep recesses containing the escape stairs; the roof canopy is planned on a cross-axis in order to tie together, visually, the two halves of the building below. The scale of the canopies, each of which hovers over one half of the estate was considered not only in relation to this particular building but also to the space between the several buildings at ground level. The cellular form of the 120 flats in this block suggested a strictly rectangular shape but—rather than echo this—we felt a contrasting form in the roof superstructure would be better. Thus the two water tanks are designed in the form of giant saucers flanking the vault over the lift motor rooms, the whole being raised well above the level of the roof terrace; the shape is a composition of flat planes and parabolic curves, although the latter are limited to curvature in one direction owing to the costliness of shuttering of double curvature or an irregular shape.

Community centre: Mr. Richards asks if the community centre was not the right place for the kind of sculptural flourish that takes place almost too excitingly on the roof, and suggests that the community centre and the roof structure ask to be interchanged. We think it fair to counter this suggestion with another rhetorical question: if there is truth in Mr. Richards's observation near the beginning of his criticism—where he suggests that there may be too many architectural components chasing too few plain surfaces in the community centre court—would not the inclusion of a quite different architectural form have aggravated this situation? Our view is that another shape within this court would have been too much, whereas, by the time the eye has travelled up the plain surface of the high block, a contrasting form is a welcome relief.

General criticism: Apart from the detailed points of criticism already referred to, we detect an emphasis which suggests in some respects, a difference in fundamental values between ourselves and Mr. Richards, which may be of sufficient interest to comment on. We notice his dislike of exposed concrete as such, his reference to the "unsubtle" shape of the roof structure on the high block, and his stricture of the bulbous heaviness of the black tubular hand-railing round the sunken courts; on the other hand, he several times praises refinement of detailing. We feel strongly that other values besides refinement should be pursued, particularly clarity of form and—sometimes—robustness. It is a common criticism—and often a valid one—of architecture today that it is merely a collection of details, over-refined and without much substance. We try to take such oppor-

tunities as occur to express those elements in architecture which are naturally required to be strong (such as load-bearing walls, structural concrete, or guard rails), and to contrast these with those elements which are delicate and merely screenlike in character (such as windows, spandrel panels, etc.). This contrast between the rough and the smooth, the bright and the dull—even between the clean and the dirty—creates a tension which is of the essence of architecture—when the choice of materials and the balance between them is right, of course!

Finally, may we refer again to Mr. Richards's own reservation that the general treatment of the estate should be looked at again when the whole project is finished. We think that several features and details which may appear disturbing at the moment will appear more satisfactory when they are seen in the context of the scale in which they were conceived.

The estate from Barbican. In the foreground are the four-storey maisonettes and the background is the sixteen-storey block.

News continued from page 946

TIMBER

Manufacturers' Dinner

George Grosvenor, President of the Timber Building Manufacturers' Association, regretted in his speech at its AGM that the woodworking industry was not enjoying better grading, and called for the restoration of the pre-war quality of brands. There was evidence at the meeting of a widespread opinion among the members that the timber importers were making a misguided use of TDA (on which the importers hold a controlling interest) in that they were using research to develop new (and, in the manufacturers' opinion, not very likely) markets for timber—e.g. the timber engineering scheme—when research could have been more profitably employed in improving the quality of the raw material available in this country. Reference was made by Mr. Grosvenor to the approaching termination of the DSIR grant to TDA and the proposal to set up a new "Timber Research and Development Association" which, in order to attract further state aid, would be independent of the commercial interest of TDA.

RCA

Minister's Appeal

Speaking at the 25th Anniversary Dinner of the RCA at the Dorchester Hotel on June 18, the Minister of Works, the Rt. Hon. Hugh Molson, M.P., said that he would like to see reinforced and precast concrete used to a far greater extent in the British building industry because he was anxious to economise on steel and to keep down cost. Suggesting that progress would be faster if it were easier for architects to obtain designs, he gave it his opinion that the reinforced concrete companies should

follow the example of the steel companies and set up departments to design completely preplanned concrete frames for the benefit of architects. He reported that his Advisory Council on Building Research and Development consider that the strength of completed structures in reinforced concrete is probably greater than is indicated by current conventional calculations, which do not make all possible allowances for the increase in strength which results from the inter-restraint of slabs, beams and columns; and that his Department is at present carrying out experiments with BRS on the design of floor slabs to test the truth of this opinion.

In Brief

The Victoria and Albert Museum is to hold an exhibition in November and December of this year to commemorate the centenary of the birth of the late Victorian architect and designer C. F. A. Voysey. The Museum has an excellent collection of Voysey's works, but is anxious to trace, and borrow for the exhibition, further examples of his furniture, embroideries, textiles and wallpapers. Any individual, institution, firm, etc. possessing such works or information about Voysey, is asked to send details to Peter Floud, Keeper of the Department of Circulation, Victoria and Albert Museum, London, S.W.7.

In the summer of this year the William Morris Society is arranging an exhibition devoted to Morris's association with printing. The object of this exhibition will be to bring before the public, who will be admitted free, an aspect of Morris's work which has not previously been comprehensively displayed, and so to enable an appreciation to be made of his influence upon good printing in the present century. The exhibition will be held at the St. Bride's Foundation Institute, London, E.C.4, during the first three weeks in August. From

August 19 to September 7 it will be at Leighton House in Kensington and from September 16 until October 5 it will be at the Manchester Central Library. After that it will be shown in Glasgow, at the Mitchell Library. Arrangements are being made for the Exhibition to be shown in several places in Northern Europe under the auspices of the British Council.

The annual conference of the Housing Centre, to be held at County Hall, London, on July 3-5, will discuss "Housing, Slum Clearance and the Tenant." At the last session on July 5 a team of residents from the Lansbury Neighbourhood, Poplar, will give their views on what redevelopment has meant in practice. The chairman at this session will be Chris Chataway.

The RICS had an easy win over the LMBA in their annual match, played this year on the Holloway Bros. Ground at Earlsfield. The LMBA won the toss and batting first were all out for 165 of which S. G. Wright got 80. The RICS had no difficulty in knocking off the runs, and passed the LMBA score with the loss of four wickets. A. King scored 46, B. Lindsey 49 and A. Goater was 32 not out.

Cost control in building

Six lecture-discussions

ARNOLD TOWLER

JOHN WILKINSON

5 Cost planning II

speakers: JOHN WILKINSON and
ARNOLD TOWLER

chairman: CYRIL SWEET

The CHAIRMAN: This is the fifth of this series of discussion evenings arranged by THE ARCHITECTS' JOURNAL and the Regent Street Polytechnic. I am sure we all congratulate them on having organized them. I personally, as Chairman of the RICS Cost Research Panel, am particularly interested, because we do think this is a subject which deserves a great deal of attention and thought.

As you probably know, this is the last of the actual discussion evenings. The next meeting, which is in a fortnight's time, is a Symposium at which all the speakers will be present, and that will be essentially a question and answer evening.

JOHN WILKINSON: The scheme we are going to deal with tonight is a four form entry Grammar school with 720 pupils and 816 cost places. At £270 per place the target net cost was therefore £220,320 and the maximum gross cost 10 per cent. more at £242,352. For the first time in our experience the clients stated, in a very full brief, that the total superficial area was not to exceed 57,000 sq. ft. or 70 sq. ft. per pupil. Therefore, by dividing the net cost by the total floor area, we had an immediate target for our cost plan of 77s. 4d. per sq. ft. The brief also contained indications of the standards the client wished us to achieve. Amongst these were:

Double glazing to all classrooms and the assembly hall.

Hardwood strip flooring to all classrooms and general teaching spaces.

A flush ceiling in the two gymnasia.

It was quite obvious from our own experience that these rather optimums optimisms made it absolutely essential that this design should be cost planned. So

The last two (numbers 5 and 6) of the lecture-discussions in the series organized by the AJ and the Regent Street Polytechnic appear below. The fifth was an account of the cost planning of a school by John Wilkinson (architect) and Arnold Towler (quantity surveyor), chairman: Cyril Sweett. The last was a Symposium at which all lecturers, under the chairmanship of D. E. Woodbine-Parish, answered questions, argued technical problems and discussed future developments. One future development will be the setting up of a study group. The AJ invited members of the course with cost analysis experience, to form a study group to consider the precise definition of elements. We also invited those who intend to prepare and use analyses to give us their names so that we may keep them in touch with the study group and publish analyses they prepare. More information about these developments will appear in future issues of the AJ. One other announcement made on Tuesday week was the setting up of a "Costs" Committee of the Architectural Association. See editorial comment on page 941.

with the Ministry of Education limits and with the schedule of accommodation, and brief with its special requirements we began to work. The ratio of area of enclosing wall to floor area is a factor which we all know affects the cost, and no doubt you will remember Mr. Baines discussing the point last week. In this case, however, the site had an even greater influence on the plan form than this ratio. There were not any really flat plateaux or ledges on which to sit the most economic plan form, and we therefore determined that separate units were a more economic solution for this site. The blocks themselves were shaped by the necessity of running them along the contours. Our experience has shown that the element of work below ground level can be very high if one does not plan to avoid large cubes of cut and fill, to say nothing of special retaining walls, drainage and so on. The plan we eventually arrived at (Fig. 1) we knew to be expensive in form but economical in work below ground, and we realized it was essential that the structure should be economical. Here we were fortunate. Published in the AJ a few weeks earlier were details of the Mayfield School, Putney, by Powell and Moya, where the cost per place was £72 below the Ministry's allowance. The school had exceptionally high finishes, was extremely well designed, and had two beautiful murals. It was obvious that the major saving was achieved by the use of load-bearing 9 in. cross-walls, and that where a frame had been used in the assembly hall and gymnasia it was extremely simple. The job architect made a two-day visit to the school to study any other way in which economies had been made. The effect of published cost analyses of other buildings is quite amazing in the office. The

Fig. 1 (left). Plan of the school at Scarborough. The articulated layout allows for an uneven sloping site and keeps foundation cost down. Fig. 2 (below left). Programme of drawing office work for the school at Scarborough. Notice the points at which the 3 cost plans are prepared, the final one occurring after production drawings had begun.

effect of Mayfield could perhaps be described as shattering on our ideas of cost. Throughout all these initial considerations our quantity surveyors were always willing to help—although I think it is fair to say the initiative at this stage was still very much with the job architect. I would like to show you for a moment a break down of our drawing office programme, which will give you some idea of what lies ahead (Fig. 2). Between Cost Plan 1 and 2 we made a detailed study of most of the major elements of the building over which we had control. On those elements we could not directly control—heating, electrical, plumbing and certain structural portions—we gave our consultants definite capital cost targets based on Cost Plan 1.

This study of the elements requires extremely close liaison with the quantity surveyor and we were able

to have him sit alongside us whenever necessary, discussing alternatives, making suggestions, and producing approximate estimates.

ARNOLD TOWLER: First let me say a word on estimating. It is necessary to have in your mind two sets of figures. One for pricing approximate quantities and one for accurate quantities. My definition of approximate quantities here is not so much that they are approximate in amount but that they carry, as far as pricing is concerned, most of the "labours" which are otherwise measured separately. It means that you work out an overall price for, say, reduced brickwork, which instead of being, say, 40s. per yd. sup. in accurate quantities, becomes 45s. per yd. sup. in approximate quantities.

Obviously, if you are going to do hundreds of exercises for the architect all your quantities must be done like this to save time and office costs. By the time the quantity surveyor is ready to perform Cost Plan 1, the architect has made his preliminary decisions of siting, construction, etc., as Mr. Wilkinson has already told you.

Having seen where we are going, we come to Cost Plan 1, and the first essential of any form of cost planning is to have a clear cut definition of each element, so that everyone concerned—architects, quantity surveyors and specialist consultants—knows exactly where everything in the building is being included. We have our own definition of elements based on MOE Cost Bulletin No. 4 but differing slightly in one or two cases. The second essential is a cost planning sheet settling out the elements (Fig. 3). These are all that any office really needs to start cost planning in a simple form.

We had by now completed all our planning studies and had achieved the target set by the client that the total superficial floor area should not exceed 57,000 sq

COST PLAN 2.

Fig. 3. Cost Plan 2 for the Scarborough school. Items marked "G" are still target figures based on other school costs analyses.

ft. Therefore our target cost per sq. ft. was still 77s. 4d. We decided that Cost Plan 1 should be based on the Classroom Block only. The area was 25,848 sq. ft. or some 45 per cent. of the total floor area. Looking at the other blocks and basing our judgment on the areas involved and our experience of the cost on other jobs of similar types of accommodation we worked out that a balance could be struck. The Science Block with its services and fittings was obviously going to be higher than the average for the whole school of 77s. 4d., the assembly hall was going to cost the same or slightly more, the gymnasium, kitchen and workshop would be less than average. As you will see later, these calculations did turn out to be reasonably accurate. Published cost analyses of similar jobs were

limited—and our knowledge of them was not detailed enough to use a comparative method as outlined in the recent MOE Cost Bulletin. Rightly or wrongly we took the average cost per sq. ft. of each element from seven published schools and expressed it as a percentage of the total cost per sq. ft. Using these percentages we distributed our 77s. 4d. over the elements and thus produced a target for each element.

JOHN WILKINSON: I do not want to waste time going through each element separately. The frame, as I have said, was settled as 9 in. load-bearing brick cross wall, estimates for which had to be made. The roof details were carefully worked out, and various forms of roof coverings and trusses were tried. We looked into the question of a flat r.c. roof against a pitched roof taken on a standard bay. This slide shows a quick roof calculation, the pitched roof is at the bottom. It proved conclusively that the pitched roof over this particular bay was about £200 cheaper and on £22,000 that would be about £1,000. That gives some idea of the quick calculation which the quantity surveyor is doing almost at your right-hand side as you are thinking about the details at this stage between Cost Plan 1 and Cost Plan 2. On foundations, studies were made of the use of brick as against concrete walls below ground level under the curtain wall. On the smaller elements we did quick comparative costs on the w.c. partitions, for example—sufficient to show that the cost of metal-faced plywood partitions was within our target for that element. I have asked my colleague to tell you of a major portion of our work at this stage—on the type of curtain wall to use—because he was able to give us some good advice on the subject.

ARNOLD TOWLER: We knew from experience that timber curtain walling was cheaper than metal and that a great deal of money could go in the solid panels below the windows depending upon what material was used. The architect was also keen to use double glazing and had heard of a simple system produced by a firm of joinery manufacturers. After preliminary discussions with the Principals of the firm, which revealed that the overall costs were likely to be reasonable, we got them to visit the office and went over the details of the construction. It was decided to use hardwood (mahogany or similar) and the result was that they gave us a figure of about 13s. 4d. per ft. sup. for the work including double glazing. This was then used in our calculations. So far we had not done anything to check the figure. The architect proceeded to work out his detail sizes and prepared a perspective which we asked for (Fig. 5). From this and other verbal details we produced an accurately measured estimate of one repetitive section of this unit (Fig. 4). At the same time the specialist was invited to check his own costing. His new quotation came to about 15s. 9d. per ft. sup. whereas mine came to about 14s. per ft. sup. Obviously a meeting was indicated and this took place in the architects' office. The approximate quantities which I had prepared proved of enormous value and showed, much

Fig. 6. Two sections of Cost Plan 3 (Assembly Hall and classrooms) shown on the standard pro-forma used by Grenfell Baines and Hargreaves. Compare with Cost Plan 2 (Fig. 3) prepared 5 months previously.

eventually came up with a roof using diagonal close boarding as a stressed skin which reduced the cost of the element by about 5s. per sq. ft. It rather emphasizes the danger of using proprietary systems without a very close study of their costs. We had almost reached the final stage of our programme and by this time were well into final working drawings. The sketch details made it easy to release a large amount of drafting work to quite a large staff, and you can see the quick build up here. With overtime included we were working with an equivalent of eight men at

Fig. 7. An early estimate for the workshop block based partly on cost plan figures for the classroom block. Notice the high roof figure which led to a revision in the method of construction. Items marked "G" are uncertain prices.

our peak. We now come to the final cost check and as this is more the province of the q.s. I will leave it to him.

ARNOLD TOWLER: The final cost check is applied immediately upon completion of the draft bill of quantities which is then priced at competitive rates. To arrive at the correct figure certain things have to be added and these are: an allowance for preliminaries, contingencies, drains and playgrounds. This gives you a Net Cost figure in line with MOE Form S.B.16. Preliminaries are something of a gamble to price and drains and playgrounds have to be added at so much per ft. super from the analysis. From the result the architect will be able to decide whether to amend sundry specifications or to increase or decrease any P.C. Sums, but of course the main object is to obviate gross overspending and last-minute

addendum adjustments after tendering.

Here are the final figures, on the classroom block; our last analysis gave a figure of £99,604, and this is the final estimate on the prices where the draft quantities at £83,000, preliminaries, contingencies and external works and drains added in, gave a result of £95,000 on the quantities and £99,000 on the last analysis. So we saved a little, to the tune of about £4,600 on the classroom block. This is the assembly hall block, and here the last analysis is £25,600 and the prices on the bill came to £28,900. That has come out more expensive than our analysis, and we balanced to a certain extent here. This is the science block, and the last analysis was £47,500. It came in at £49,000, so we lost on some blocks and gained on others, and we are keeping a check on the overall. The overall on the last analysis is £172,700 and our priced bill came to £173,700. We were, therefore, within about £1,000, so we are fairly happy. At the moment the bills are out to tender and we are keeping our fingers crossed. One of the results of working this system is that the quantities are best prepared in separate sections, one for each unit of the project. This entails extra work but is really essential for the sake of clarity and value in measuring variations, interim certificates, etc. Different types of units will carry different costs per ft. super, viz. classroom block, workshop block, assembly hall. The cost analysis of the different types of structure are valuable records for your files and for use on other projects.

Now a word on the other uses of cost planning.

I envisage some further subdivision of each element with costs attached, e.g. foundations into excavation, concrete in trenches, bases, ducts, floor slabs, reinforcement, formwork, hardcore, fill, etc., and frame into storey heights with separate costs for formwork, reinforcement, concrete and floor slabs. The analysis can also be used for clerk of works reports indicating percentage of work complete. Two warehouse jobs were reported in this manner and a check was kept on the comparison with our interim valuations. A remarkable parallelism was noticed which rather reinforces my opinion of the value as applied to interim certificates.

JOHN WILKINSON: To close, I would like to comment briefly on the cost of cost planning to the architect. We have a costing system in the office, which tells us at least on which jobs we are down. We have found that the most expensive jobs are the ones where redetailing is necessary, because of not hitting the cost target—the larger the amount of redetailing the more expensive. Therefore, in as much as cost planning, if successful, avoids redetailing it is economic. Cost planning also means that the job has to have been completely thought out and thus you get an accurate bill of quantities, with better site supervision and better post-contract administration. To sum up, the cost of cost planning is a little more than the cost of doing a straightforward job where you chance your arm and are lucky in your tenders. That does not take into account the many unpriceable advantages from which the office should benefit.

Discussion

J. M. POWELL (quantity surveyor): I noticed from the architect's programme that from the beginning of work up to the completion of working drawings was about fourteen months. I wonder at what stage during that time the drawings were sent to the quantity surveyor for him to start his final measuring for the bill.

JOHN WILKINSON: The first draft of the bill of quantities for the classroom block was ready one month after our Cost Plan 3. In January we first priced the draft bill of quantities for the classroom block, which gave up confidence to go on.

ARNOLD TOWLER: The planning was dealt with block by block, and as we came to a satisfactory conclusion on, say, the classroom block, the architect increased his staff of detailers to produce their working drawings. We were still doing cost plans on, say, the science block. As soon as he was ready to turn over his working drawings to us, which happened by about January, we started on the bills of quantities, and we managed to keep ourselves going by working out satisfactory cost plans for each block. The architect was doing his working drawings, so we were planning and doing bills of quantities one at each end of the office, if you like, until the last set of details came in.

G. T. WEST (architect): How did the tenders compare with the costing prices?

JOHN WILKINSON: I should explain that we took this school because it is the latest one we have done and obviously the most full one we have done on the cost planning basis. Tenders should be in at the end of June. We are pretty sure they will be all right.

We have studied the area. We have done work in that area before, and we know the way the builders price to some extent.

G. T. WEST: Can you give us some idea of the order of accuracy of the tenders on previous jobs compared with the cost plans, as this is the whole point of the exercise?

ARNOLD TOWLER: On one job which was not fully cost-planned, we estimated it to be £120,000, and the tender came out at £117,000. Another which we estimated to be about £95,000 came in at about £93,000. Generally, we seem to be at the price of the third tender.

G. HARRIS (quantity surveyor): How much of the total £172,000 is covered by prime costs for nominated sub-contractors on which you have received offers of tenders during the design stage?

ARNOLD TOWLER: Very little. We try for various reasons to cut out prime cost sums entirely.

G. HARRIS: You mentioned that you were dealing with comparatively proprietary structure. Do you deal with that as a prime cost?

ARNOLD TOWLER: It proved to be too expensive, and we went on to one the architect designed himself. Where we have specialist items, we do not put them in as prime cost sums if we can avoid it but specify them, and we do not always specify that particular specialist. We do try to cut prime cost entirely.

JOHN WILKINSON: It is part of the policy of our office. Recently we got an electrical consultant in our own organization, and we are wondering whether we dare start billing the electrics. Where the work is itemized he has managed to get prices from electrical sub-contractors now for a specific number of points. Whether we shall get right down to heating, I do not know, but it is part of our policy.

On this job the figure for prime costs was something like £65,000—a large proportion for the proprietary system of curtain walling which we discussed. We did check that very carefully; as Mr. Towler has told you. In another case, the workshop roof, we found that a proprietary system was very expensive. We therefore designed our own, and it came out much cheaper.

J. W. BURTON (architect): The example we have had tonight has been for an entirely new building on a virgin site. Would the team say whether they would advocate this system of cost planning for an addition, even a major addition, to an existing building?

ARNOLD TOWLER: If a large part of the addition was a new wing out in the adjoining ground, I should say why not? You may have to make some adjustments for the part where it joins the building. But where it was mainly alteration, we do not think you could do it.

D. A. AYRES (quantity surveyor): I wonder if you would give us some idea of the period of time between the receipt of the particulars and the issue of tenders, and whether Mr. Towler could give some idea of the additional time element spent by the quantity surveyor's office in preparing the cost plan over the normal time in producing the bills of quantities.

JOHN WILKINSON: I think we got the job in January, 1956, and began to collect information from the client. We started work in the latter end of February and we have just gone out to tender now. That is over a year—14 to 15 months.

ARNOLD TOWLER: We are not fully employed by any means on giving estimates of costs. We may only use half-an-hour a day, or one day and go a week without doing anything. I did not begin at the outset to keep separate records of the time spent, but I do now. Extra work is certainly involved, but very often it is to your own advantage. You do not have a lot of "argy bargy" after the tender comes in.

A. C. ALLEN (architectural assistant): When you design a particular element or a staircase or block system, do you find on your next job that you can stick to that? Would it tend to throw your estimates out to uncover any fresh information you might not have had in the first place?

JOHN WILKINSON: We have done it, but it was on jobs of a very similar nature. If you get the price for the frame of a warehouse, say, you can use the information gathered for that particular study again and again. But I think you would have to start from the beginning for any new building. One could not expect information to be transferred from one to another precisely. According to the new bulletin, No. 4, pro-

duced by the Ministry of Education, there is a very excellent method of using a building you really know to prepare a cost plan. I do not think you could use a building of a completely dissimilar nature. Comparison is made in quantity and quality. The quality will probably come more and more into it as time goes on. Even if you make a comparison in quantity, say, of partitions between a building of which you have an analysis and your own new building, you can by proportionate methods get at a target for your new building. Does that answer your question?

A. C. ALLEN: Yes, thank you.

THE CHAIRMAN: We have had a most interesting evening. It has been an example of team work between an architect and a quantity surveyor. They have demonstrated very clearly to us how they have worked together with engineers and specialists and consultants, and they have also demonstrated to us the benefit that they hope for to the client from that collaboration. The idea of preparing three cost plans and pricing the draft bills, as well as preparing the bills of quantities, does rather appal me. It seems to be a great deal of work, and there can only be some occasions when the time can be found to do that amount of work. No doubt the main reason is that there is so little information at the moment that one can use. We have an example of the usefulness of publishing all this information in the reference to Mayfield. This, through the publication of cost information in *THE ARCHITECTS' JOURNAL*, inspired the architects to consider cross-wall form of construction for their school, with advantage to the client.

Estimating or costing, as you all well know, is by no means an exact science. There are so many things that can throw your estimate right out. It can only be a question of cost research and cost planning. The main purpose, I think, is to give you the relative costs of various ways of building with various techniques.

What has been demonstrated tonight is that the architect and quantity surveyor right through have been trying to achieve what the client wants, something satisfactory to the architect, at the lowest price. When we realize that a saving of 1 per cent. in the cost of building would produce a saving of some £20 million a year, we realize how important this is.

The great problem of cost research and cost planning is one of time and cost. I know how difficult it is to persuade people to collaborate in cost analysis which is necessary to produce this background of information, this library of cost information, which one hopes will be useful to the whole industry. The main reason is that the full significance of cost planning and cost research has not got hold of people. I think it will do so, and if we can only get people to think in that way and go forward together—architects, quantity surveyors, builders and the rest—evolving a common form of analysis and presentation, so that jobs are automatically analysed and the results published or reported in some way, we shall achieve something.

Cost control in building

At the final meeting of the course, on June 18, all the lecturers were present. Left to right, Frederick West (Howard Farrow Ltd.) deputising for Ivan Tomlin. Michael Austin-Smith, John Wilkinson, D. E. Woodbine Parish (chairman), G. Grenfell Baines, Clifford Nott, Arnold Towler (speaking) and James Nisbet.

6 Symposium

chairman D. E. WOODBINE-PARISH
all speakers were present

The CHAIRMAN: I would like first to express our thanks and appreciation to THE ARCHITECTS' JOURNAL, and particularly to John Carter, for having promoted this series of lectures by very eminent people.

The purpose of this meeting is to recap the discussions which you have had and to provide an opportunity for some real audience participation. The pattern of this evening will be that each speaker will recap on what he has said, for some two or three minutes, and then the meeting will be open for a general discussion by way of comment and question.

We started with the general and went to the particular, and in the recap now we shall do it in reverse.

ARNOLD TOWLER: We find that the incentive is from the architect, who must approach his quantity surveyor with inquiries on cost of different systems of construction. The quantity surveyor will then begin to produce estimates of cost for each type, until a certain type is decided upon. Another basic consideration which he must have is a list of elements. You can get these from published information, or you can compile your own for your own requirements. Another important thing is definitions. Published information is a big source of information here, and you may have some views on how this can be improved. Having cost-planned the job, do you bill it by elements or by blocks? By blocks you get different sets of costs for different types of building; the big, aching void of an assembly hall as contrasted to the compactness of a classroom, with its fittings and services.

The next step is to price the draft bill before it is typed. Having produced three cost plans at various stages, we must then see where we are, hoping that we are on the nail and perhaps make some final adjustments. The object of cost planning is to achieve value for money rather than to effect rigid economies in all types of building. It allows you to spend money in the wisest way, getting as much as you can in each

element throughout the building within the set total. Finally, there are the uses of cost analysis and planning after the contract is let—uses to the works representatives and uses to the contractor in planning his job—planning the costs and ordering the materials, etc. I leave you with that.

JOHN WILKINSON: We cost plan in three stages—beginning with cost plan 1, which is the target cost based on either experience or published information. In the example we gave we did it from seven published schools, of which we took the average. That is a point with which some of you may disagree, and I hope that we shall get some questions. Having got cost plan 1, we go into preliminary cost questions—for alternative erections and for different elements, so as to make comparisons. Here we have our quantity surveyor to help us. Half way through the process we do cost plan 2, which is an interim statement of the position in relation to the whole building, to see that we are not going off the rails and that the overall cost has not gone outside the cost limits. That can be done quite quickly. Being assured, we go into sketch working drawings—which is quite a normal process in architects' offices—for the whole job, so that we have fairly definite details settled before the bills of quantities are prepared or the final working drawings are started. The object of this is to assure ourselves that we do not then have a lot of drawings to rehash should the cost plan not work out. We next have cost plan 3, which is the final check before we go into working drawings. Some may think that this is a very long-winded way of working, but we have found that it gives the right answer. The tenders come in to the cost plan. We are fortunate in having a very co-operative quantity surveyor. I should like to hear the views of quantity surveyors, as to whether they work to a similar system (I see one or two sceptical smiles) and whether they think there are any short cuts that

can be taken. On the general question, we should consider the ultimate purpose of this cost planning—whether we should accept the architect's traditional rôle, in which a certain price is given him by the client as to the amount of money to be spent, and which he spends in the best possible way. I feel that that is right, but there may be other opinions.

G. GRENFELL BAINES: I began by trying to show how, as a designer, I could see that skill in the distribution of money could add content to a design. I felt quite sure that you would sense that economy came naturally, just as did a sense of proportion and the rest. It is not merely a question of cheapness, but of cost control.

I went on to give acoustic and structural analogies, where a better knowledge of the distribution of sound or the distribution of physical stresses could inspire form and surface treatment. We have at least 25 years' experience in acoustics and many more in structures, whereas the tools for cost distribution at the moment are few and are still being forged. No doubt there will be a Mark X tool before we are finished. Architects must be responsible for giving a lead and telling quantity surveyors what is needed in the way of tools.

I also spoke about the combination of performance and of standardization with costs. The establishment of a number of cost performance norms will be very helpful in our profession. Anybody's ideas on the sort of combinations of those things which would help in design will be very welcome. I spoke of the importance of "through-prices"—not merely the floor finish but the preparation for it, and even its potentialities for taking surfaces. I would underline Towler's point of the importance of standard definitions so that we can compare our cost plans with those of other people, just as we now compare the photographs of finished jobs.

That brings me to my final point about the various uses. One of the most valuable uses is in obtaining the exact requirements of the client and establishing an understanding with him. He is just as interested in a cost plan as in a sketch plan, and when it is presented diagrammatically it can help him to understand what we are getting at. Another use is in programming. Building programmes can definitely be framed on cost analyses. One of its most valuable uses is the way in which it brings the quantity surveyor into close contact with the job as a designer. A change of mind may be necessary but it will brighten his outlook and enrich his experience to work with us as a co-designer, and thereby enjoy all the creative possibilities. I feel that we should make a teaching technique of this, possibly at post-graduate level.

CLIFFORD NOTT: I want to start with the fourth member of the team—the contractor. He is looking for some improvements in the bills of quantities. As competition is getting keener he will need a better bill if he is to put in properly considered prices.

Without a doubt every contractor interested in the technique of costing and programming jobs and time-and-motion studies will find that some form of elemental bill will probably be as good a tool as he will

get for some time to come. There are all sorts of future developments to consider, such as bills of quantities divided to show labour, material and overheads as separate items, and that sort of thing. We find that some sort of elemental bill gives the contractor more information upon which to put in a considered tender. Tonight you may like to consider a slightly modified system which we are now trying out, to reorganize the bill back into trade order, but to divide the trades up into elements. That gives the contractor the chance to price each trade right through. But the breakdown into elements will give an annotation, which so many contractors are calling for. The day after I gave my lecture we met at Herts some 15 contractors who had built our schools, with the object of seeing how we could speed erection on the site and improve other contract relations. The cry there was that the contractors want fully annotated bills so as to allow of simple one-column explanations. They want trade bills divided into elements, with every possible indication of where those quantities are in the actual building. Whether you leave the estimator to price each individual quantity in each place or adopt some method of setting out by which you collect the total of every similar item after the analysis is made to bring it through to one figure, I leave you to think over. Mr. Baines said that the client is interested in cost planning, and I bear out his statement. There is nothing more encouraging both to architect and to quantity surveyor than to go in front of a committee which is considering a project and to present it with an estimate which is in the form of approximate quantities. With cost analysis behind you you have got prices for group and bulk quantities—or the price right through from the floor to the other side of the ceiling. Committees, architects and clients can see that the quantity surveyor has made a genuine attempt to price every item of which he knows the story, and the gaps in his information are quite patent to the architect and client, and they can be brought forward and filled up as necessary. Jobs can be tailored in the early stages. Mr. Towler mentioned that his firm did three cost plans for a job. That may be essential when individual jobs have to be planned, but with repetitive programmes you have not got to lay down a cost plan for every job three or four times. What appears to be quite a labour in repetitive cost planning is reduced considerably.

FREDERICK WEST: I am standing in for my colleague, Mr. Tomlin, but I am not under the party whip! He told you that to a contractor the bill of quantities had to serve more than its prime use, which was providing an instrument in tendering. That being the case, the conventional bill has many disadvantages. Mr. Tomlin went on to outline the various uses the bill had to serve. He took you through the tendering procedure in a contractor's office and outlined the advantages and disadvantages of the elemental bill from the contractor's point of view. It is new, and largely unknown to contractors. This means that we have to have a certain reorientation of our ideas in order to appreciate it and make better use of it. At the tendering stage the estimator must work through the

bill, pulling out his various items and put them together in one trade total. That will give you a more accurate tender, but it means a great deal more work for the estimator to do and it takes longer to prepare inquiries for sub-contractors.

On the other hand, it gives the estimator a much better idea of the operational sequence of the work, and will lead to more realistic pricing. That must always be to the client's advantage, in that all the difficult pieces of work will be shown up at their true value. It is more useful in planning. When planning a contract with the conventional bill the quantities have virtually to be taken off completely. The quantity surveyor will never let us see his dimension sheets, so we have to do that work over again. That is largely obviated with the elemental bill. It helps to produce more accurate costing. The work done can be much more quickly related to the work in the bill. It means the quicker assessment of work done by the main contractor and a quicker assessment of that done by the sub-contractors, leading to a quicker settlement of their accounts. It leads to much quicker valuation. There is one point made by Mr. Nott which I should like to repeat. The elemental bill loses 50 per cent. of its advantages when it loses its annotations. They are the real grist for the contractor.

JAMES NISBET: First, on the method of cost analysis. The unit: square foot of floor area was chosen mainly because we decided that it was the best unit of accommodation, bearing in mind that we generally live in two dimensions and not three. Secondly, the breakdown of that cost per square foot is related to the functions of the building—the groups of functions in which the architect designed. In other words, we are trying to cost the main functions of the building as they are envisaged by the architect. That immediately brings in the question of the relationship between the architect and the quantity surveyor. So often the quantity surveyor's training is isolated from that of the architect, and it is not until he gets into practice and has had a good deal of experience that he comes up against the architect and his thoughts and philosophies. One of the things that will happen with the use of analyses is that quantity surveyors and architects will get together earlier and learn each other's job. The third point is the benefit of cost analysis in a much wider field. I do not think that anybody would disagree with the statement that there is a lack of public confidence in the building industry when it comes to the matter of cost. Most quantity surveyors would probably agree that they are not brought into the building project early enough. It seems to me that these two situations have something in common, namely, that we have not established a common language between the quantity surveyor, architect, client and builder. The client may have a very large sum of money to provide, and he is a little at a loss to know why it should be so much. In most cases he will check up to see if he is getting value for money. He will go off and try to relate some other buildings to the one he is having designed for him. What we

must do is to present costs in such a way that they are meaningful to the client. Mr. Baines has also suggested that he has found cost analysis by elements helpful in that way. I think that it is this lack of a common language which causes the quantity surveyor not to be brought in sufficiently early. He deals with the prices of materials—and these are not the terms in which the architect is thinking in the early sketch design stage. He is thinking in a wider context. As quantity surveyors we must try to produce some system which will give the architect the costs of this wider concept. We feel that this use of elements at least forms the basis from which to start. Some people may say that if we start giving the client and lay people more information we shall create tremendous difficulties for ourselves. But I feel that the professions and the industry as a whole are bound to benefit if we can do something to dispel the *mystique* which seems to those outside to exist within the industry. If we can dispel that, the professions and the building industry as a whole are bound to benefit.

MICHAEL AUSTIN-SMITH: I shall refer to only three of the main principles. First, this idea is still in its infancy, and there is still an enormous amount of work to be done. You will not go away with a cut-and-dried scheme. Secondly, I think this technique of cost control is only one of many management techniques which we must introduce into our offices. One is that of getting sufficient information from the client. If you do not do that, in the middle of your cost control the client may change his mind. You have to have the client in the proper frame of mind. The question is posed: Do we introduce these techniques one by one, and wait until we have perfected one before starting on another, or do we advance on a broad front, with all the members ticking over together? I have my own views on that question. Thirdly, it must be emphasized that this is a team effort. It is not an individual thing, it is a team effort between the client, the architect, the quantity surveyor and the building contractor. What is required is the right attitude of mind among all those four people. This attitude of mind must admit of change, and it must also be able to appreciate the other's point of view. With it must go a really burning fire of conviction that we can, by building fact upon fact, make advances towards our real goal of better architecture.

The CHAIRMAN: There is now one hour available for members of the audience to participate in this evening's session, raising questions, making points, and so on. You should know that the gentlemen sitting on the platform have lunched together today and, as a result, quite a number of subjects were thrown up. It may be that one or two may arise this evening which will be a little off the wavelength. If so, I hope that you will be favourably disposed if I keep you within certain limits; otherwise we shall have the building industry reorganized too soon, possibly to no great advantage.

Part of the audience at the symposium on June 18.

Discussion

M. H. THACKRAY (quantity surveyor): The main hurdle which we must surmount is that of the swapping of information. We have heard from Mr. Baines how satisfactory this cost control is working in a group; it has worked well in the Ministry of Education and in the Hertford County Council, and many other places where they are working within a group. I heard the suggestion that it was merely a matter of the wish to preserve secrecy which was preventing the exchanging of information. I do not think that that is true. I think that most people realize that there is frightful danger in exchanging this information without exchanging the whole facts. When a group prepares this information the composite parts know what goes in where, and so on. That is the biggest hurdle. We must get over it if we intend making information available. *THE ARCHITECTS' JOURNAL* had a shot at it, and I think it would be just to say that that is the difficulty—to make sure that everybody is putting the same things in the same elements. That is something which one of the lecturers may care to reply to. I want to make a really earnest appeal to everybody not to muddle or confuse terms, such as the terms "annotated bill" and "elemental bill." We were interested to hear that Mr. Nott was experimenting with a hybrid, somewhere between the annotated and the elemental bill. In a report of this meeting the two terms might get confused, and I earnestly appeal to those concerned to see that that does not happen.

CHAIRMAN: In case anybody wishes to cross swords—we are adopting the same principle as Humpty-Dumpty, who made words mean what he wanted them to mean. "Cost control" really means "expenditure control." "Cost control" is historical and "expenditure control" is a bit of "Piddington" work; we are looking into the future. But we must not produce any confusion.

G. GRENFELL BAINES: I would not like individual practitioners to feel that there is any really great difficulty in their being able to practice the technique of being able to distribute costs as desired; there is not. It can be helped enormously by published information, but we must define the basis upon which the information is published in order that people are not led astray. I do not think that individual architects are so lacking in intelligence that they would not make some intelligent adjustments if there were some discrepancies in the cost plans. Nevertheless, the accuracy of the basis upon which information is exchanged is important, and a study group might get to work on that as quickly as possible, so that journals doing cost information would do it on the same basis. I think that even a little information is better than none, however.

JOHN CARTER (*ARCHITECTS' JOURNAL*): I want to follow up Mr. Thackeray's point about definitions. We have been publishing analyses now for about two years and we are well aware that there is not always enough information given for you to know what each element contains; therefore the prices are not as useful as they might be. Our main object in publishing was to interest people in analysed costs; to get them to think about breaking down the costs. It is obvious that you cannot be precise about a technique until some experience of it has accumulated. The time has now come when we can begin to be a little more precise about the definition of elements. *THE ARCHITECTS' JOURNAL* is proposing to invite those who have knowledge or experience of cost analysis to form a small study group—by small I mean ten or twelve members—who must appoint their own secretary to do the donkey work. The *JOURNAL* will provide some hospitality, and the premises for their meetings. The object of the study group is to examine the possibility of a

standardized list of elements, with definitions as to what each element contains. The purpose is to produce a little *aide memoire* which can be handed to quantity surveyors, so that all analyses produced will be comparable, one with another. At the same time, those of you who have no previous experience of cost analysis but who, as a result of coming here, want to go away and try it, we would like to keep in touch with you. I have arranged for paper and pencils to be provided in the foyer, and if those who are interested will leave their names we will compile a list. If you have any problems, write to us and we will try to help you. If you produce any analyses we would like to publish them. The form of publication would obviously be related to whatever standardized form the study group arrives at. Would those who wish to form the study group please write to us at the *JOURNAL*?

MICHAEL AUSTIN-SMITH: I think that that is a very good thing. One of the vital problems is what is contained within these elements. If we have that the door begins to open for various groups and bodies of people to begin to collect their analyses on some common basis. We will start on a common basis and improve by means of facts and not mere opinions. I am instructed to tell you that the council of the Architectural Association have now set up a committee of their council to look into this matter of how cost analyses can be collected, analysed and disseminated. If *THE ARCHITECTS' JOURNAL* will consolidate the ground they have gained and produce a standard method of analysis which they can publish, anyone finding that his building does not quite fit can easily say in which respects, and he can give the reasons. It is a very fine thing for the *JOURNAL* to do, and it is good to know that they are prepared to publish cost analyses on top of their own. As a commercial magazine they have hitherto had to pick out buildings of interest to the people buying their magazine, when they have published analyses, but it will now be possible to achieve what we need to get at the real facts—possibly up to 30 or 40 buildings a month being analysed, instead of 30 or 40 a year. [The Editors: steady on!]

P. A. DIXON (architectural assistant): Mr. Wilkinson gave us a very good idea of the work of designing that went into a building before it was finally billed and tendered. Was that formerly the practice? If not, how much does he consider that contributes to more accurate tendering at the final stage?

JOHN WILKINSON: The system of sketch working drawings was not the common practice before we started this cost planning system—at least, not to the present extent. On the job which I mentioned we have done nearly 100 sketch working drawings, and they help to produce a more accurate cost plan. Possibly the process of producing them also tends to give a more accurate picture of the cost, but how much that influences it, I cannot say.

GRENFELL BAINES: It is always interesting to know what goes on in the office when you are away from it so much! We did

not do it in the past. We used invariably to go wrong and put a lot more work into putting things right. Now we do less work in the end. It is merely that we have pulled a lot of work forward to where it should be—at the beginning. I agree that the technique of sketch working drawings has developed very much from cost control and has shown that our whole procedure of doing work or production drawing was wrong in the past.

H. G. EDWARDS: (quantity surveyor): That is one of the most interesting features of the whole discussion—the fact that cost control is compelling quantity surveyors and architects to pre-plan.

It might interest you to know that after some false starts my partner and I formulated three rules to give consistent results in allocating items to elements. Rule 1 is to allocate each item by its cause. For example, to the element "Windows" in a building of traditional construction we allocate the lintols and items of construction around the windows which would not be there if the windows were not there. That is different from the Ministry of Education's, but it seems to me that they are inconsistent. The application of that first rule usually leaves only a few small items. Rule 2 is to allocate by order of construction. For example, if an item does not belong either to the frame or to the external walls we would allocate it to the frame because that is erected before the external walls are built. That is a quite arbitrary rule, but it gives the answer. We use this rule only in so far as small items are concerned, which are usually of no significant value. Unfortunately we get the awkward item, such as expensive stanchion casings, which we deal with by Rule 3. In the case of stanchion casings we would divide the cost between the frame and the internal finishings and make a note about it on the analysis. I do not suggest that we cannot devise better rules, but we have tried them in about 20 analyses and we find them workable, and they keep our analyses consistent. We also keep a separate element of builders' work in connection with services. On a recent contract we found that this worked out at £6,753, which was equivalent to 2s. 9½d. per sq. ft. of the building. That was a significant figure and it led to an investigation. In the end reasons were found for it, but in the ordinary way we would not have discovered it. Lastly, I would like to cast your minds back to a few years ago, when we were dealing with prices per foot cube of building, with no idea of the effect which the shape and size of the building had on the price. How much farther we are on the road now to a sensible approach to cost building, thanks to Mr. Nisbet and his colleagues.

CLIFFORD NOTT: We have come to the same solution, but one point is worth thinking about. Mr. Edwards referred to the knotty case of stanchion casings, and the question whether they should be put with the frame. If the frame had been a decent job to look at, you might not have put a stanchion case on. Is it part of the external walls? It might be worth considering that item in relation to the difficulty in pricing.

If you are going to use elemental bills, it is probably better not to split the item as to cost partly between the frame and partly the walls. A hypothetical splitting does not help the estimator to price an item any better; in fact, it might mislead him into thinking that it is done in two separate operations.

GRENFELL BAINES: I liked the first rule, but I must take up the second one. You cannot break the frame up into the various parts that it serves, but if you do decide to have a frame individually it helps to combine a number of items in groups when making comparisons. As an example, an exposed concrete frame can contribute as much as 10 per cent. of the external wall area, whereas with a curtain wall job it is just a question of running past the columns, without combining the two things. You must compare by groups.

JAMES NISBET: I would refer you to my own talk, when I said that the choice of elements—elemental bills apart—depended on a number of considerations. One might be the form of construction and the second might be the sort of functions or the units in which an architect designs. When you bring in elemental bills you have to bring in the quantity surveyor and his procedures, and the builder and the way he works. You have four separate things to consider; in the analysis you have only two.

H. F. KERLEY (quantity surveyor): In cost planning and cost analysis there is danger of too great an accuracy, when one bears in mind the considerable variation in tenders, owing to the state of the market and the area. I think it was Mr. West who referred to the impossibility of access to the quantity surveyor's dimensions and abstracts. I have never been asked for them, but it occurs to me that photostat copies might be provided. It would be helpful to the contractor pricing bills, if much more notice were taken of the note advising that the basic drawings were sent to contractors tendering. That would obviate the necessity of putting 200 yards of concrete in one place and 500 yards in another, because the contractor would be able to see the distribution.

CLIFFORD NOTT: You do not only want dimensions: you want the take-off drawing. If you have to give them to contractors they have to be complete and self-readable. A taker-off working under pressure will short-circuit a number of things and although the dimensions are properly signposted the thing would still not be complete. In general it would be dangerous for quantity surveyors to offer their work, however good, for open use by the contractor. If the contractor thinks he requires more information for planning we ought to be able to produce that information by one simple process. In other words, I think that the contractor would be happy if he got good annotation, without seeing the dimensions.

FREDERICK WEST: He would be happier, but during planning stages one often wants far more detail even than the annotations give. If we had access to the dimensions and abstracts, and the taker-off's drawings it would save us an awful lot of work which has already been done once. Mr. Kerley is

an exception, and I should like to leave him my business card! The usual answer when one approaches a professional quantity surveyor is "You would not understand them"—given in a very scathing manner. I say again, with Mr. Kerley, that the more information you can give us in the way of working drawings at the tendering stage the more accurate our pricing will be.

GRENFELL BAINES: On this question of over-accuracy and market fluctuations, I do not think that our concern about that is valid on the whole question of cost analysis operation. Prices can either be up or down. If they are down it is a pleasant surprise—and very few architects are stuck for ideas how to spend extra money! If they are up you have with cost analysis a much better basis upon which to do something about it. I do not want to misunderstand Mr. Kerley, but I do not think that this question of fluctuations is a serious one.

ARNOLD TOWLER: In collecting information for cost planning we must beware of the exceptionally low tender, which may, with the first, second, third and fourth close together, be another £8,000 away. As to sending out drawings with the bill of quantities, we have started to do that and contractors have found it a great help. We have also started to annotate bills on the outside page. I shall be interested to know in more detail just what information the contractor would get from the take-off at the tendering stage or any other stage.

CYRIL SWEET (quantity surveyor): If the contractor wants to see the dimensions and abstracts I think that he should be shown them. It seems to me ridiculous to expect him to do all that work over again and arrive at a different answer and then produce documents to prove that you are right or wrong. Mr. Thackray drew attention to possible confusion between annotated bills, which is a new expression we have heard this evening. Some contractors want elemental bills and some want annotated bills, but we have no evidence that contractors, as a whole, want either one or the other, as a matter of preference. Another point is the question of where you stop with an element. Mr. Baines referred to the necessity of including stanchions with curtain walls, but how much does he include? On cost analysis, we should consider broader things and take the structure as a whole with the external cladding walls and partitions, and compare them with the different types, and with any other form of framework. We could do a theoretical analysis to establish the relative cost of one technique as compared to another. The important thing is what it costs to do a thing in one way as compared to another. The importance of this course is that it has made us all cost-conscious. It we are cost-conscious we plan properly and spend our clients' money sensibly, and there is a proper distribution and the avoidance of disillusionment when the tender comes in and work has to be cut out. We need to know the relative costs of different techniques. If the architect, from the inception of the job, thinks about what he is doing and what the cost will be, and whether he

could do it cheaper and satisfactorily, he will have learned the main lesson to be derived from this subject.

GRENFELL BAINES: I did not want to mislead Mr. Sweet, and I hope that I have not misled you when giving my example of the way in which the frame can contribute to the cladding. I used the example merely to emphasize the importance of classifying by broad groups.

G. T. WEST (architect): Mr. Nisbet, in the second lecture, was at pains to show us the difference between a cost analysis and a cost plan. Cost analysis is an attempt to find out why costs vary, and what factors make them vary. In cost planning, on the other hand, we take target figures, which we have to accept, and take percentages and make a simple average. Cost analysis is a much more exact activity, and if there is one way in which schools of architecture can help it is in the theoretical study of the way in which various factors affect cost. We could mention twenty different factors, given us during this course, which affect cost. We do not know how they affect it, and a study of that subject is essential if we are to make cost plans more realistic. For cost analysis, we must take figures seriously. We may find that the elements we need for cost analysis are different from those that we need for cost planning.

JAMES NISBET: I agree 99½ per cent. with that, but I want to stress that cost analysis and cost planning are very closely related because the cost analysis provides the data for setting our targets. Hence, the choice by the MoE of the set of elements and their relation to cost planning. If you are trying to decide whether a steel frame is cheaper than a concrete frame, Mr. Sweet's suggestion of grouping fits in perfectly well, but if you want to take that information on to cost planning you may have to break it down into little bits, bearing in mind that the little bits of each group are not necessarily comparable, like with like. Secondly, cost analysis does not give you the answer to any specific problem; it is designed to give you a method by which you can find the answer to your own problem. It is a method of working rather than a final answer.

G. POWELL (quantity surveyor): Mr. Baines said that he had so far not made use of elemental bills of quantities. Knowing how interested he is in this problem of cost control, I wondered whether there was some positive reason for this. Could his quantity surveyor tell us if, not having to put elements together in a bill, it frees him in preparing his analyses?

GRENFELL BAINES: The reason why we do not use elemental bills *at the moment* is that we have been getting all the information we wanted from our quantity surveyor without them. Having quite a lot of things to attend to ourselves we do not worry ourselves unduly as to how he gets at the answers. They have been fairly correct up to now. I underline the words "*at the moment*" because I have a feeling that, just as we have been driven to developing our design details much more than we used to do, by having to give our quantity surveyor lots of information, he may also be com-

pelled to change his methods because of the questions we shall be asking him in future.

ARNOLD TOWLER: I have not yet produced an elemental bill. I should think that the main call for an elemental bill will come from the contractor. I cannot see that it would help the architect very much more than what I am producing at the moment. Its real value appears to be in estimating and thereafter in other spheres, which I can satisfy with the present techniques. I can usually get out an analysis within 36 hours (of working time, not consecutive, of course). If I can see advantages to be gained in building time I am quite willing to adopt elemental bills, but this is something which must be developed, and I think that the contractors should be consulted.

J. P. COUSINS (builder): I was extremely interested in Mr. Nott's suggestion of a hybrid elemental bill classified by trades. I rather feel that from the contractor's viewpoint such a bill would be very much more useful than a pure elemental bill, in which one might find bits of concrete appearing from Folio 10 to Folio 510. Before Mr. Nott made his suggestion I was very much in favour of the standard method, with very thorough annotation to a specification. One of our major problems is to ascertain where certain things are going in a job, particularly with the Joiner, where there are thousands of feet of frame and it is almost impossible, without going to the quantity surveyor, to find where it goes. The second very important problem is that of complete drawings before tender. In the past we have found that one of the greatest difficulties arose from sections of the bill which appeared to have been produced by the quantity surveyor using his imagination as to what the architect was likely eventually to design for a certain stage of the job. That has caused us endless problems to sort out after we have gone through a very detailed progress and cost plan. From a contractor's angle, two of the most important things are detailed drawings and elemental bills classified by trades.

CLIFFORD NOTT: That confirms the opinion I have developed as a result of what I have heard from many contractors in my area, and I would like to ask his opinion as to whether or not he thinks the old form of elemental bill with a trade index was better than a bill divided into trades, in the same order as they now appear, but the index consisting of the elements, made in such a way that you can price it and bring out a total?

I am proposing to include in the description column of a bill an open summary to allow a contractor, if he so wishes, to sub-total the elements within his trade. He can carry them to his element summary, which will give him a planning summary, which will give him assistance in planning his job while pricing. Mr. Sweet mentioned the question of the quantity surveyor showing his dimension sheets to the contractor. I agree that he does not do this, but the trouble lies in the timing. The contractor wants them not when the job has started but when he is pricing, and there may be 12 contractors. It may be that photostat copies are the answer. We would like to be

able to help, but I think that the information should be given in the form of a summary.

CYRIL SWEET: I should have thought that if the bill were prepared properly, and important points such as repetition were brought out in the bill the contractor would have all he wanted.

FREDERICK WEST: I think that I have been misunderstood. I was not suggesting that contractors wanted a sight of the dimensions and abstracts at the tendering stage, but contractors today are using modern management techniques, planning costing and budgetary control, and if contractors could have a sight of these documents it would avoid much duplication of work.

ARNOLD TOWLER: Some revisions to the bill are obviously necessary. The main thing that a contractor will get from the elemental bill is a knowledge of the distribution of materials throughout the various parts of the building. I am quite surprised to hear people referring to the Joiner, with so many thousands of feet of material, being baffled as to where it is. The joinery trade is the very one which does not need annotation. An item saying "Plaster to walls," obviously belongs to the walls. Anything which cannot be put into the description of the item should be done by way of annotation. In a bill of 100 pages, you would need to annotate only about 40, and the descriptions should take care of the rest. With a schedule of finishings at the back, which the quantity surveyor has used for his taking-off, his plans and scale drawings, should give the contractor a good picture of the building.

PETER TRENCH (Bovis Ltd.): I want to make three quick points. I want to take Mr. Nisbet up on his statement about public confidence in the building industry. That is a big point. All four members of the building team have some responsibility in this matter. I leave the builders aside at the moment. Of architects, I say that many have been the occasion in the past where estimates have been made by architects on a foot-cube or foot-super basis without consulting the quantity surveyor, let alone the builder. They have produced prices which have been wildly out. That is one of the factors which has caused a certain amount of lack of public confidence in the building industry. If this course has done nothing else but sound the death knell of foot-cube and foot-super "guesstimates"—in other words, if we have found out how to work out how much a building will cost with some form of scientific analysis—it will be bound to do an enormous amount of good. The word "fact" has been used by several speakers. I ask quantity surveyors and architects whether they are in possession of those facts. As I understand it, cost analysis is price analysis, and we have heard that the lowest tender is not always the right price. The day will come when builders themselves know how much things cost and when that day comes they may share their secrets with the others. The only people who should know are the builders. Mr. Thackray talked about cost analysis and cost control, and I think that the Chairman

said that the terms should be "price analysis" and "expenditure control." That is something which follows from these lectures. Cost planning and analysis is one thing, but controlling the cost of building once it is started is another. We could easily run a course for builders and others showing how you should first measure your work and see whether or not you are making a profit and, secondly, how to find out how much the ultimate cost of the building is likely to be.

The CHAIRMAN: I shall now give the lecturers an opportunity of adding a postscript on the evening's discussion and upon any points which have been raised.

GRENELL BAINES: For me the course has shown the importance of information and of the exchange of information for all the designers who have not the time to build it up in their own offices. If what has been suggested about a better basis for information is followed out that will perhaps be the best service that can be carried out either by the profession or the Press.

CLIFFORD NOTT: From this course of lectures I have learnt one thing, at least, namely, that although we have now been doing this for two or three years and have done £2 million or £3 million worth of work with pure elemental bills I have not yet decided whether the system that we are using is 100 per cent. the answer. Only last week, as you have heard, I thought of rearranging the bill, but any new development will have to be something very much better.

ARNOLD TOWLER: I should like to say something about the publication of analysed results and also the fact that the various associations are, in varying degrees, making investigations of costs. I have a feeling that at the moment they are not running parallel, but are diverging slightly from each other. I think that they should get together and institute a form of liaison, working upon a common basis. THE ARCHITECTS' JOURNAL has done a wonderful job. Architects derive much inspiration from these results and if they are keen enough they go to see the job. They are not satisfied just with the analyses; they send their staff to the jobs to photograph and report. That is a further development arising from the reading of these published results. The other professional journals should take this up. There are so many buildings being constructed that we cannot have enough of these analyses, provided that they are all upon the same basis, with the same list of elements and the same items going into them. That is something which could come out of this course of lectures, and which would be a step in the right direction. JAMES NISBET: Somebody made the point that drawings were not always complete when bills of quantities were prepared. One factor in this is the architect's lack of confidence in the preliminary costings. If, by analysis and cost planning, we can help the architect to produce the drawings quickly we shall be making a contribution to pre-contract planning.

I want it to be known that the success of this course of lectures is very much due to THE ARCHITECTS' JOURNAL and in particular to John Carter, who had the idea in the first

place and the courage to go to the Regent Street Polytechnic and persuade them. Our thanks are also due to them for having the courage to stage this course, which has been extremely successful.

JOHN WILKINSON: I want to address my remarks to architects. After a course of this sort there is apt to be a general feeling that the matter is a little complicated. My plea to architects is not to wait until the next job comes along before starting cost planning, but to take the one that they are already half way through. All that is needed is a simple list of elements. Put in the prices and gradually build the thing up into a complete cost plan. If you wait until you have got everything in the office organised, with long lists and various information filed away and you wait until you have assimilated all

that you will be moving very slowly.

MICHAEL AUSTIN SMITH: I think that that answers the question that I posed, namely, whether you should start on a broad front or wait until you have one thing completely buttoned up before you start on the next one. I think that you must move along generally. I was asked whether I knew what was going on in America. I managed to get hold of an American magazine. It does not go into terrific details, but it is a regular publication and is called *Costs and Trends in the Building Industry*. I also received this pamphlet which says, "Once you start to plan you soon find a way of going wrong."

FREDERICK WEST: What impresses me as a result of listening to the previous speakers is that this question is one of team work. The architect, quantity surveyor and builder

Next week we shall print a complete list of cost analyses published in THE ARCHITECTS' JOURNAL.

technical section

8 ESTIMATING

current wage rates, market prices and measured rates

8 Estimating. Current wage rates, market prices and measured rates

are all members of a team, and it is obvious that somewhere in our training we have to get together. It would be an excellent idea if architects could spend their final year with a contractor so that they could get to learn our building techniques (and we could get to know what makes them tick!) To the architects I would say, "You are the natural leaders of the team. For heaven's sake be the leaders."

JOHN CARTER: First, I should like to express my thanks to Mr. Nisbet for his kind words. Secondly, to take up Mr. Towler's remark about several different bodies being interested in this business and tending to go at variance to each other—that is not really true. We keep in touch with each other and co-ordinate as much as possible. Thirdly, I want to give a reminder of our invitation to volunteers for the study group, to write to us, and for those who intend to cost plan to leave their names, so that we can keep in touch.

The CHAIRMAN: I am delighted to hear that it is the intention of THE ARCHITECTS' JOURNAL to set up a study group. There is a tremendous need for a work study of the whole process by which a building is designed, and afterwards put up. Until recently we have not realised that we have to do that work study together and address ourselves to the problem in the offices of architects, quantity surveyors and builders, and also on the site. I believe that a reduction in building costs generally, or an increase in productivity, of the order of 7 per cent., is not outside the realms of practical possibility if we address ourselves to these problems, which stem from an acceptance of the fact that management has a very much larger part to play in the industry than we have realised in the past.

We have to address ourselves to developing the training of the leaders in all sections of the industry—those who will directly encourage and inspire the people who design and carry out the building. On the development of management techniques, we realise that we need all the tools in the kitbag, or the weapons in our armoury, to deal with our problems. These must all be integrated for the architects, quantity surveyors and builders, and anybody concerned with directing the activities of other people. As a result of these six lectures we have begun to see that the road lying ahead of us is a hard one in connection with which we must do some courageous, bold and imaginative thinking in order to put right some of the conditions which exist today which are not satisfactory. I should like to express our thanks to the Polytechnic for having provided an opportunity for these meetings to be held, and also to those speakers who have come here tonight for the second time to take part in this final symposium. Once again we thank THE ARCHITECTS' JOURNAL for its inspiration, which has made these lectures possible. May it go further in the work that it has started, and may it have the full blooded support of those who are here tonight, and all those whom they may be able to influence as a result of what they have been told in these lectures.

Almost all the changes this quarter are accountable to the wage increase of May 27. This naturally has a greater effect on items where the labour content is relatively high (e.g. items under *Excavator*); but since it is a recent event we can assume that we shall soon see some further small advances on the materials side also. Prepared by Davis, Belfield and Everest, Chartered Quantity Surveyors. Market prices and measured rates last appeared in the JOURNAL for March 28, 1957.

Wage rates

Rates of wages rose on May 27, 1957, and are now as follows:

	Craftsmen		Labourers	
	s	d	s	d
London District	4	7½	4	1
Within 12 miles radius	4	7	4	0½
From 12 to 15 miles radius				
Liverpool and District	4	7½	4	1
Grade classifications				
A	4	6	3	11½
AI	4	5½	3	11

Market prices

Prices are given for the major items in each trade, they are intended as average prices and include delivery in the outer London area. They do not include overhead charges and profit.

Measured rates

Prices are for work carried out in the Outer London area and include 10% to cover overhead charges and profit except in the case of work which would be carried out by specialists when 5% has been allowed.

The prices given in *italics* represent the total value of the materials included in the measured rates, including an allowance for waste and 10% for overhead charges and profit. The cost of labour included in the measured rates (including its proportion of overhead charges and profit) can be ascertained by subtracting the prices in *italics* from the prices in heavier type.

Abbreviations

Inches: in. Feet: ft. Yards: Y. Yards cube: YC. Yards super: YS. Feet cube: FC. Feet super: FS. Ton: T. Feet run: FR. Thousand: M. Square: Sq. Number: No. Hundredweight: C. Pound: lb. Gallon: Gal.

Preliminaries

To all estimates based on prices for measured rates add for Preliminaries, water, insurances, etc., depending on the nature of the job, say 10%.

Price changes

* Shows changes in market prices and measured rates since the last issue (March 28, 1957).

SUSPENDED FLOORS AND FLAT ROOFS

A complete service

If your site of operations is in the Midlands or South of England you need only reach for the telephone and a complete service for suspended floors and flat roof construction is ready to move into action.

- ★ If you require it, a technical representative will call and discuss the project at drawing board stage.
- ★ A detailed quotation will be given.
- ★ A complete layout drawing will be supplied immediately our quotation is accepted.
- ★ For supply only orders, we will arrange prompt delivery to phase with your building programme.
- ★ For supply and fix orders a skilled team of Marley erectors, fully equipped, will proceed with the construction when required.
- ★ Quantity output from strategically placed factories ensures that deliveries are prompt. Erection at the present time is confined to the Midlands and Southern areas.

MARLEY EAGLE BEAMS

TECHNICAL ADVANTAGES

Marley Eagle Beams are exceptionally strong but with very low dead weight. They require no shuttering or centering and provide high fire resistance with excellent thermal and acoustic insulation. Comprehensive data of performance factors is given in Marley publication MC11.

REQUEST FOR INFORMATION

Please tick where required.

- ☐ I attach my letterhead. Please send me full literature on Marley Eagle Beams.
- ☐ Please arrange for a Technical Representative to call at my convenience.

Please write to your NEAREST Branch

It costs less to filter
air through Fibreglass.
The filters themselves
are low in price and
high in capacity—while
their low resistance
to the flow of air means
that smaller fans of lower h.p.
will blow it through.

**the finest
air filtration
medium**

Five thousand years we've waited . . .

for CARLITE pre-mixed plaster

Aha! A revolution in plaster and about time too. Five thousand years is a lot of 44-hour weeks, but it is roughly the number of years that Man has been plastering with heavy sanded plasters. The first advance of basic importance in all this time is Carlite.

Carlite is a *pre-mixed* plaster, and in it sand is replaced by a lightweight aggregate of Perlite, which is premixed with gypsum in the factory.

The advantages of Carlite are many. Already it has won the calculating (but human) hearts of architects and builders, who are using it on scores of their biggest contracts. If you are still unaware of just what these advantages are, full technical information is available. Send us your name and address today.

All U.K. buildings at Brussels Exhibition

At the 1958 World Exhibition at Brussels the British Government Pavilion and the British Industries Pavilion will occupy approximately five acres.

The Architects for the Government Pavilion are Messrs. Howard V. Lobb & Partners, who are also the co-ordinating Architects for the whole of the U.K. site.

The Architects for the British Industries Pavilion are Messrs. Edward D. Mills & Partners, and the Consulting Engineer for both Pavilions is Mr. Felix J. Samuely, B.Sc., M.I.C.E.

Building the modern way

with large Aluminium Structures

Few better examples for the employment of large aluminium structures can be found than aircraft hangars. These buildings require totally clear floor areas combined with very high clearances and the all aluminium hangar illustrated is an excellent instance. Built for the Ministry of Supply, to Ministry of Works specification, it has a clear span of 200 feet through its huge power operated aluminium doors, a clear height of 50 feet and an unrestricted depth of 250 feet. Just another instance of modern building techniques developed through the specialist services of Hawksley SMD — readily available to architects everywhere.

That's the job of

HAWKSLEY SMD

FULLY-INSULATED AND SEMI-INSULATED PANELS.

ASBESTOS-BACKED PANELS.

PANELS FOR PURELY DECORATIVE USES.

VITREOUS-ENAMELLED CURTAIN-WALL INFILLING PANELS.

Manufacturer: Vitreous Enamelling Works (V.E.W. Ltd)

19.H1 VITREOUS-ENAMELLED CURTAIN-WALL INFILLING PANELS

This Sheet describes vitreous-enamelled panels for infilling for curtain walls or as facing material. These panels are extremely durable, easily maintained, and available in an unlimited range of colours.

Material

The panels are of 16 g. sheet steel of guaranteed enamelling quality. The outer surface is finished with vitreous porcelain enamel which consists of a layer of glass melted at about 850° C. on to the steel, with which it forms both a chemical and mechanical bond. The glasses used have been specially developed for this purpose and have a high degree of resistance to thermal and mechanical shock. The thermal expansion of the sheeting is very low.

Types

The following four types of panel are available:
Fully insulated, for use where the panels form the complete wall.
Semi-insulated, for use with a backing wall.
Backed with asbestos board, for use where insulation is not the main consideration.
Unbacked, for purely decorative uses.

Construction

The insulated types of panel have all edges of the steel sheet bent to an angle of 90° to form a tray. Battens are screwed to the inside of the tray on all sides through the turned up flanges. The battens are normally of Tanalised timber, but asbestos battens can be provided where it is necessary to use completely incombustible materials. The tray is filled with mineral wool of heavy density to provide the required degree of insulation, a vapour barrier of bituminised kraft paper or aluminium foil incorporated, and a back panel of asbestos board screwed to the battens. Any other suitable insulation or backing for the panels is available on request.

Where insulation is not important the steel sheet is backed with asbestos boarding either clipped into the tray or resin-bonded under pressure to it, the latter method being the more expensive.

Unbacked enamelled sheeting for decorative purposes only is usually bent over at the four edges, either at 90° or 180°, to stiffen the panel.

Sizes and Weights

The panels can be supplied as required in sizes up to 4 ft. 0 in. in width and 6 ft. 0 in. in length. It is possible to produce longer panels but it is not recommended.

The approximate weights of panels are as follows:

Fully insulated: 4½ lb. per sq. ft.
Semi-insulated: 4½ lb. per sq. ft.
Asbestos-backed: 4 lb. per sq. ft.
Unbacked: 3 lb. per sq. ft.

Thermal Insulation

The "U" values for the types of panel previously described are given below, but the thickness of panels can be adjusted to give any required figure.

Fully insulated: 0.19 B.t.u./ft.²h.deg. F.
Semi-insulated: 0.28 B.t.u./ft.²h.deg. F.
Asbestos-backed: 0.55 B.t.u./ft.²h. deg. F.

Colours and Finishes

There are no limits to the number of colours which can be produced: any colour in BS. 2660:1955 or the Munsell range, or intermediate shades, can be produced. Designs or lettering can be incorporated without difficulty.

Three types of finish are available as follows:

Plain glazed which has the maximum corrosion resistance but has a highly reflecting surface, which is a disadvantage, especially where large areas are used.

Semi-matt or eggshell finish which is an attractive finish but has a rather lower resistance to acids and alkalis than the glazed finish and is therefore less suitable in areas of heavy atmospheric pollution. Colours in which red is predominant cannot be produced in this finish.

Glazed and figured finish. The figured surface breaks up reflections but has all the advantages of the plain glazed surface, e.g., it has the maximum resistance to corrosion, can be produced in any colour, etc. This finish is strongly recommended by the manufacturer for walling purposes.

A surface with stone chippings fused into the enamel is also produced but it holds the dirt and is difficult to clean.

Fixing

The panels are intended for individual mounting in frames of suitable section which are obtainable from most window manufacturers. Frames are sealed with normal window mastic but they should be so designed as to be mechanically waterproof without relying on the mastic. Where the frames are of inadequate depth to accommodate the full thickness of the insulated panels, a rebated edge can be provided ⅜ in. thick, as shown in the drawing on the face of the Sheet.

Applications

Vitreous-enamelled panels may be used for infilling in curtain walls of any construction either decoratively applied or functioning as part of the structure. Their use makes possible the incorporation of name-panels or other devices as a permanent part of the building. The backing board of insulated panels may be of polished hardboard or similar material where a finished surface is required.

Maintenance

The panels are normally kept clean by rainwater, but should it become necessary to clean them a damp leather is all that is required.

Further Information

The manufacturer maintains a technical advisory department which is available to answer questions and advise on problems relating to this subject generally.

CAPILLARY AND COMPRESSION FITTINGS FOR LIGHT GAUGE COPPER TUBES.

Manufacturer: Imperial Chemical Industries Limited, Metals Division

33.B3 CAPILLARY AND COMPRESSION FITTINGS FOR LIGHT GAUGE COPPER TUBES

This Sheet describes various types of capillary and compression fittings for jointing light gauge copper tubes. The drawings on the face show details of different fittings; given below are notes on making the joints and the range of fittings available and their uses. The fittings comply with B.S. 864 : 1953 and suit light gauge copper tubes to B.S. 659 : 1955 and B.S. 1386 : 1947.

Capillary Fittings

Intex P.T.: These are pre-tinned brass fittings made from hot stampings or castings or hydraulically formed from seamless tube; they are for use with tubing from $\frac{1}{8}$ in. to 2 in. nominal bore.

The joint depends on the principle of capillary attraction, therefore cleanliness and accuracy of fit are essential if it is to be successfully made. Tube ends should be checked with a sizing tool and any deformation corrected; they must also be thoroughly cleaned with steel wool. The interior of the fitting is pre-tinned and wiping with a clean rag to remove dust is all that is necessary.

There are two methods of assembly (see face of Sheet):—

1. P.T. brand solder paint (a specially prepared mixture of solder and flux) is used to coat the tube ends before insertion in the fitting. Heat from a blowlamp is applied and the solder, which is liberated from the paint, seals the joint.

2. A good quality solder wire, melted by a blowlamp applied to the joint, is run between the fitting and the tube, the tube ends having been previously coated with a non-corrosive flux. In either case a temperature test should be made by removing the blowlamp and touching each end of the joint with solder wire. If the wire melts, sufficient heat has been applied to make a perfect joint, which should be allowed to cool undisturbed.

These fittings may be used for general domestic installations including hot and cold water services, gas services, space and panel heating installations employing hot water and waste and vent pipe services. As there are no coupling nuts, installations can be easily chased into walls, if required.

Endex: These fittings are similar to the above but are not pre-tinned, therefore the interior must be thoroughly cleaned with steel wool before assembly. They are for special installations that require brazing or silver soldering.

Compression Fittings

The range includes Instantor and Kuterlite (non-manipulative, to B.S.864. Type A.) and Coneor (manipulative, to B.S.864. Type B.).

Instantor: These fittings are manufactured from hot stampings or hard castings in brass only and are for

use with tubing from $\frac{1}{8}$ in. to 2 in. nominal bore. They are also available in special sizes for tubing not covered by B.S.659.

Kuterlite: These fittings are all manufactured from high quality hot stampings in brass and are for use with tubing from $\frac{1}{8}$ in. to $1\frac{1}{4}$ in. nominal bore. These fittings have been designed to meet the need for a reliable fitting, lighter than the Instantor but embodying the same double-interlock principle.

With Instantor and Kuterlite fittings no preparation of the tube is needed, but the outer surface should be free from reeds or deep scratches.

When the coupling nut is tightened an annealed brass ring is compressed on to the tube giving a permanent and positive grip.

These fittings may be used for hot and cold water services, heating installations and waste and vent pipe services. They may also be used in the engineering industry for jointing tubes conveying lubricating oils and other liquids, and generally for jointing polythene tube (e.g. I.C.I. Alkathene) to B.S. 1972.

Coneor: These fittings are manufactured from first-quality gunmetal castings for use with fully-annealed copper tube to B.S.1386 (e.g. I.C.I. Kuterlon). These fittings, available in sizes $\frac{1}{8}$ in. to 1 in. nominal bore, have an integral cone except in straight couplings. A simple forming tool is used to flare the tube end before assembly. The coupling nut compresses the shaped end of the tube between a chamfered compensating ring and the cone.

Joints made with these fittings are unaffected by vibration of lateral pressure and are therefore particularly recommended for underground services.

Fittings

All the above fittings are available in a wide range of straight couplings, bends, tees, crosses, stopcocks and valves.

Finish

When required the fittings may be supplied with polished, plated or tinned finishes.

Further Information

Further details of the full range of fittings for all joints may be obtained on request from the manufacturer.

working detail

WINDOWS: 54

SHOPFRONT, SHOP IN SOUTHAMPTON

Oliver Carey, architect

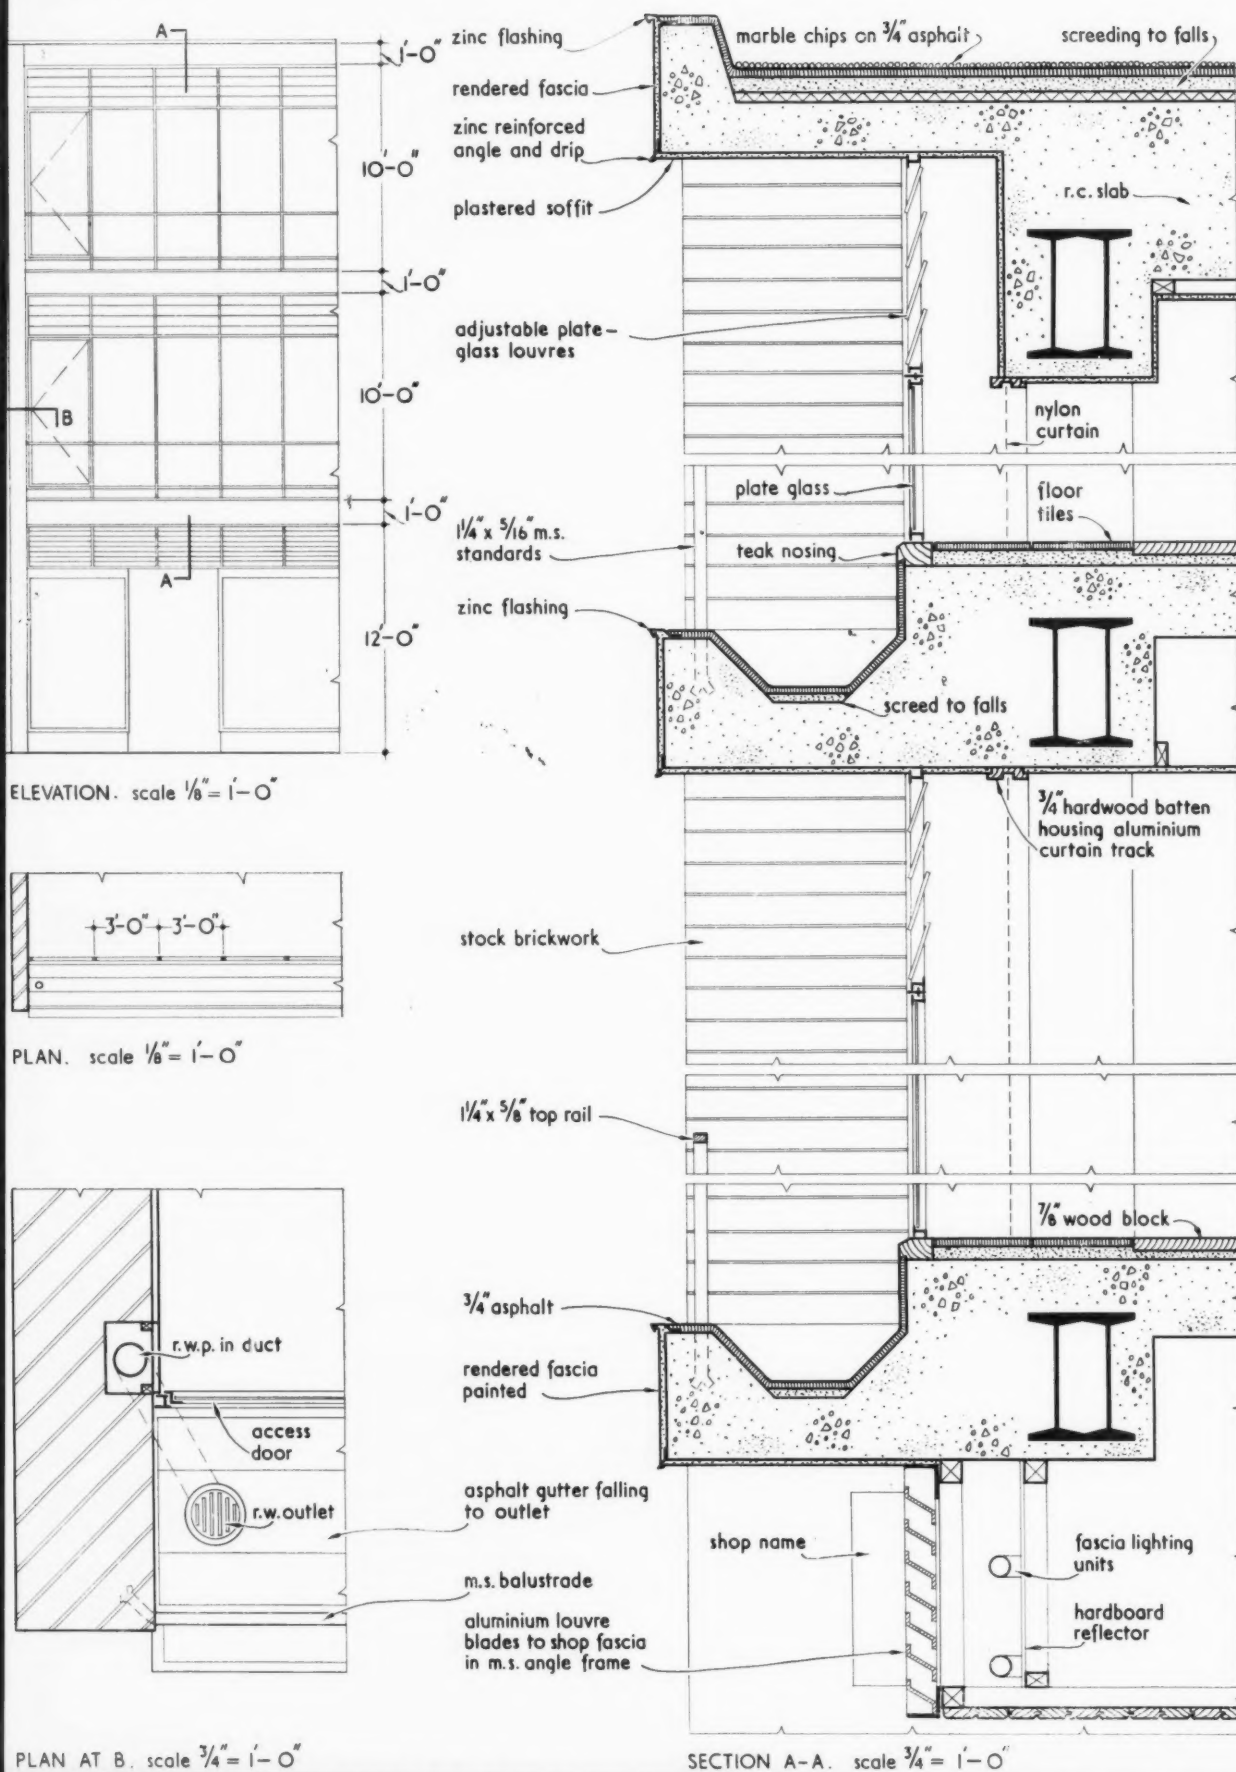

Points to notice about this shopfront are the manner in which the glazed front is recessed to provide a walkway for easy cleaning, the consistent use of one-window ventilators to avoid the need for opening lights (the extreme right- and left-hand lights on the upper floors are in fact french doors to give access to the walkway) and the total concealment of the rainwater outlet and down pipe.

Steelwork is the most compact, homogeneous and resilient structural medium.

Its characteristics are consistent and dependable so that calculations are simple, straightforward and rapid.

There is nothing haphazard about the steel members, which are accurately prepared in specialized workshops.

Steelwork has been established as the outstanding structural medium of the world.

The British structural steel industry is at your service, with well-equipped fabricators throughout the country.

***Much more
than
skin deep***

The beauty of Vicrtex—rich gay colours and fascinating textures—goes right down deep. That is why Vicrtex can be supplied in light pastel shades which keep their appearance for years with just an occasional wipe with a damp cloth. Cleaning doesn't remove the beauty of Vicrtex; it renews it again and again.

Vicrtex is an inspiration for wall treatments, an investment for upholstery, and a wonderful opportunity for harmony in both.

Vicrtex

VICRTEX won't scuff, fray, peel, crack. Can be draped, pleated, folded. Wipes clean with a damp cloth. Is flame resistant—and practically indestructible. Is available in a range of textures and colours.

BUS SHELTER IN ALBERT SQUARE, MANCHESTER

This bus shelter, in Albert Square, Manchester, was designed by Leonard C. Howitt, Manchester City Architect. It is based on a 9-ft. grid, and is constructed with an in-situ reinforced concrete roof on 3½-in. by 3½-in. aluminium columns which are in effect casings to reinforced columns. The panels between the columns are heavy section aluminium windows glazed with armourplate glass, with a kicking panel faced externally with a light blue porcelain enamelled steel sheet, bonded to a core of asbestos and with a heavily stippled aluminium sheet internally. The guard and handrails are aluminium. The shelter is electrically lit, and incorporates a timekeeper's office at the far end. The contract figure was £7,559, and the general contractor was G. & J. Seddon Ltd., Walkden.

CONJURING WITH SPACE!

The liberties you can take with space are endless when you enlist the help of the ESAVIAN principle of partitioning. The doors and partitions slide quickly and smoothly, causing no obstructions, and can be made in the most attractive and appropriate materials for the job. They are as much at home in houses, schools, or offices as they are in factories, aircraft hangers or ships.

If you have any space partitioning problems which you think the ESAVIAN principle might be able to solve, may we suggest you get in touch with us?

These two sound-deadened Partitions (Type 700) in pencil-striped sapele mahogany show the flexible use of space at the Students Union Building Council Chamber, University of London. Architects: Adams, Holden & Pearson, F.F.R.I.B.A.

Mercury House★— Another fine building enriched by Gay's paints

EMPHASIS ON COLOUR

When the cautious creams and near-whites of pre-war decoration are abandoned for bolder colours, the results may be triumph or disaster. Personal taste, however impeccable, is no sure guide outside one's own home.

Because of this, many architects use Gay's colour advisory service when functional schemes are wanted for factories and offices or when architectural features of public buildings need enhancing with colour. Every week Gay's experience grows, through stimulating co-operation with architects in private practice and in local government service.

Gay's Paints

COVERS ALL SURFACES—

Tracked vehicles or steel-shod trucks leave no impression on this toughest of all floors. It resists wet or dry abrasion, dilute acids, alkalis, oils, greases, etc., and is dustless, waterproof and NON-SLIP. Korodur is a diamond-hard non-metallic quartz that can be laid seamless or applied as inch-thick tiles. Extremes of temperature leave it unmoved! Truly the toughest floor in the world!

For engineering works, factories, warehouses, truck lanes, stores, etc. this is the floor to withstand continuous foot and truck traffic and real hard wear. Its smooth, solid seamless surface is resilient enough to obviate cracking or crazing. It stands up to hard knocks, grease, oils, petrol, etc.—and is fire-resistant. Goes over timber or concrete. Available in many attractive colours, so easy to keep clean.

All who specify, lay or use floors—are invited to use the Surfex Flooring Service. Advice on the right type of flooring for any purpose is freely available, with simple instructions for laying any of the flooring described. If preferred, a Surfex team of flooring craftsmen will lay these superb floors anywhere in Great Britain.

Send to-day— for free brochures J2 and details of these labour- and money-saving floorings. The floors that can be laid so quickly yet last so long.

Surfex Flooring COMPANY LIMITED

these heaters are in fashion...

Belling ZEPHYR CONVECTOR from £10.10.3

The Zephyr undoubtedly sets a standard for modern convection heater design, and finds a ready acceptance not only with those who appreciate warmth at the touch of a switch, but with those who appreciate good design.

Finished in old gold and bronze, it would be difficult to better this combination of good looks, and efficient, safe performance.

The Zephyr is available in 1, 2 and 3kW sizes and in portable and wall fixing types. Elements are completely concealed for absolute safety.

BELLING PANEL FIRES

Belling Panel Fires are available with firebar or reflector type elements. They are very attractively styled with insets of chrome or bronze, and panels in a choice of bronze, cream, silver or silver green and can be fixed to any wall very quickly and neatly without any need for cutting away plaster or brickwork.

Full details of these and other Belling Fires can be seen in the 64-page Belling Catalogue. We will be pleased to send you a copy for your files.

Here are some of its outstanding features

- ★ Will fit any standard tile surround with an opening 16 in' or 18 in. wide and not more than 22 in. high.
- ★ It is not necessary to cut the tile hearth.
- ★ The underfloor air can enter the fire base from any one of six positions.
- ★ Strong steel ashpan needs emptying only once a week.
- ★ The damper lever fully controls the burning rate of the fire.
- ★ Back boiler to provide ample supplies of hot water can be fitted.
- ★ Extension trivet can be supplied for overnight burning with safety.
- ★ Bottom grate carrier frame can be removed without disturbing the firebricks.
- ★ Balanced secondary air is introduced between the bottom grate frame and side linings without necessity of a separate control.

The design of the "SWINTON" Sunken Fire is such that the air inlet pipe can be placed in any one of six directions to suit the most convenient position for the entry of air. This advantage, together with numerous others, makes the "SWINTON" the best sunken fire on the market.

Introduced many years ago, 'Sirapite' Plaster rapidly established itself as a first-class product. Consistently developed and improved, it is now generally recognised as the ideal finishing plaster. The following supplementary 'Sirapite' products are manufactured to the same high standard:

'SIRAPITE' BROWNING

(Retarded Hemi-hydrate)
Class B, type 'a'.
The quick-setting undercoat plaster. Specially produced to enable surfaces to be rendered and set in one day. High covering capacity. Good insulating and fire-resisting properties.

'SIRAPITE' BOARD FINISH

(Retarded Hemi-hydrate)
Class B, type 'b'.
For use as a single coat on plaster board, fibre and other wallboards.

Full technical service available, including consultation on site.

Electrical Installations

*a handbook
for architects
and assistants
edited by
Brian Grant*

THIS BOOK DOES NOT SET OUT TO be a technical work on electricity, but is designed to provide architects and their assistants with all the essential information they need for the efficient planning and supervision of electrical installations in cases where no consultant has been employed. The book will also help them to specify and obtain good materials and workmanship, as well as to choose the most suitable available fittings and accessories for the job in hand. In addition it will give them a fair understanding of questions they are likely to be asked by consultant engineers or contractors when working on larger jobs, and so enable them to deal intelligently with any problems that may arise. The majority of the contents were first published in the *Architects' Journal*, but they have now been revised and enlarged for presentation in book form. The size of the book is 8½ x 5½ in. It contains 100 pages including some 100 line diagrams and half-tone illustrations. 16s. net, postage 8d.

Free House!

It wasn't supposed to be an invitation. The trouble is so many old locks do no more than just keep the door closed (and sometimes not even that) whilst real security measures are non-existent. The safest course if you value your property is to re-equip all important doors inside and out with the world's most reliable locks — YALE. There are YALE locks and padlocks to meet every security risk. Here is an example:

M.555 LEVER MORTICE DEADLOCK

The latest lock for keeping out the uninvited 'guest' from lock-up premises. Designed to meet insurance requirements, it is a 5-lever deadlock operable by key from both sides. Differs are obtainable on levers only and not by use of wards, making it extremely difficult to pick. Its steel reinforced deadbolt and 10" steel striking plate make it almost impossible to force. Available ex stock; literature on request.

Where there's a door there's a need for

2 MILLION HUNDRED- WEIGHT OF CALCARIUM

on the recommendation of architects and professional painters all over the country

It is experience that counts and no one knows better than the professional man who is responsible for results. Architects specify CALCARIUM water paint for indoor and outdoor surface decoration in country, town or by the sea; builders and decorators recommend it and use it in large quantities. Why? Because it is recognised, by those who know, to be the best economy—a good investment.

TIMBER DECAY calls for prompt diagnosis . . .

Whether caused by prolific insect borers or insidious fungal rot (some species of which have the destructive effect of a slow fire), timber decay should be accurately diagnosed by specialists and arrested before expensive replacement becomes inevitable. The experienced survey staff of Richardson & Starling Ltd. undertake inspections and tender detailed advice on remedial measures.

effective control materials . . .

"WYKAMOL" This unique insecticide requires only one application to effect the total extermination of Death Watch Beetle and other wood-borers, and confers complete immunity against further attack.

"RESKOL" Powerfully toxic to all fungi causing decay in timber, this special solution of pentachlorophenol can eradicate even the virulent Merulius (Dry Rot).

The superiority of these materials has been proved in practice time and time again. They are available to all users.

guaranteed treatment by experts . . .

Unless the varying characteristics of beetle infestation or fungal rot are fully understood, successful eradication should be ensured by the employment of specialists. In the course of several years' reliable work, the services of Richardson & Starling Limited have been used in hundreds of important and historic buildings, including Cathedrals, Churches, Universities and ancient mansions. The careful treatment carried out by her highly trained team of expert operatives is covered by a ten-year guarantee of efficiency.

If you have a problem of timber decay, write now for full details of Services and prices of materials incorporated in our free technical brochure "The Control of Insect and Fungal Destroyers of Timber".

Salary range £749-£1,160 (Women £744-£1,088). Starting pay according to age and experience.

Further particulars and application form from Establishment Officer, Department of Health for Scotland (Room 30), St. Andrew's House, Edinburgh, 1. Closing date for applications 12th July, 1957. 6615

CITY OF WINCHESTER

Applications are invited for the post of ARCHITECTURAL ASSISTANT in the City Engineer's Office (C. C. Steptoe, A.R.I.B.A., Chief Assistant Architect). It is essential that the applicant should be a neat and accurate draughtsman and have had previous experience in an architect's office. Salary, according to experience, will be within Grade II of the National Scales, and the appointment is subject to the Local Government Superannuation Act.

Applications stating age and details of experience, together with the names and addresses of two referees, should be addressed to the City Engineer, Guildhall, Winchester, and should reach his office not later than Monday, 8th July, 1957. Canvassing, either directly or indirectly, will disqualify.

R. H. McCALL, Town Clerk.

Guildhall,
Winchester.
6th June, 1957. 6671

WORTLEY RURAL DISTRICT COUNCIL

(Population 46,500—Rateable Value £451,790.) Applications are invited for the following appointments:—

(1) SENIOR ASSISTANT ARCHITECT. Salary in the range £737-£921 per annum.

(2) ASSISTANT ARCHITECT. Salary in accordance with A.P.T. III of the National Scales (£656-£784 per annum).

Housing accommodation offered with both appointments.

Applications, with the names of two referees, should be submitted not later than 13th July, 1957.

ADRIAN M. KELLY, Clerk.

Council Offices, Grenoside, Sheffield. 6701

BOROUGH OF BARKING

BOROUGH ENGINEER AND SURVEYOR'S DEPARTMENT

Applications are invited for the under-mentioned appointment:—

TOWN PLANNING ASSISTANT, Grade A.P.T. I/III Special (£543 5s.—£861 per annum), plus appropriate London weighting.

Application forms and particulars are obtainable from the Borough Engineer and Surveyor, and should be returned to the undersigned not later than 9 a.m. on 6th July, 1957.

E. R. FARR.

Town Hall, Barking, Essex. 6708

FIFE COUNTY COUNCIL

DRAUGHTSMAN required for the County Architect's Department, Cupar. Salary scale £595/£715. Must be quick and accurate. House may be available. Applications by 6th July to the County Clerk, Cupar. 6762

COUNTY BOROUGH OF GATESHEAD

Applications are invited from qualified and experienced persons for the following appointments, which are subject to N.J.C. Conditions:—

SENIOR ASSISTANT ARCHITECTS, A.P.T. VI (£902-£1,107).

Applicants must be Registered Architects and should be Corporate Members of the Royal Institute of British Architects. They should have had good experience in the design and construction of Public Buildings, Schools and/or Municipal Housing Schemes.

ASSISTANT ARCHITECTS, A.P.T. IV-V (£727 15s.—£994 5s.).

Applicants for Grade IV must have passed Parts I and II of the Final Examination of the Royal Institute of British Architects, and for Grade V must be Registered Architects. Previous experience with a Local Authority would be an advantage.

All above posts pensionable, subject to medical examination and one month's notice on either side.

FAVOURABLE CONSIDERATION WILL BE GIVEN TO THE PROVISION OF HOUSING ACCOMMODATION IN CERTAIN CASES, ON A RENTAL BASIS.

Applications, on forms obtainable from the Borough Surveyor, Swinburne Street, Gateshead, 8, must be returned to him not later than Tuesday, 9th July, 1957.

C. D. JACKSON, Town Clerk.

Town Hall, Gateshead, 9. 6700

CORBY DEVELOPMENT CORPORATION

Applications are invited for appointments on the staff of the Chief Architect. The immediate vacancies are for ASSISTANT ARCHITECTS within the salary grades:

A.P.T. IV (£728 to £907).

A.P.T. V (£815 to £994).

The work of the Corporation affords wide experience in the design and construction of houses, Town Centre buildings and factories, both in large schemes and in individual buildings.

Appointments will be subject to superannuation under the Local Government Superannuation Scheme, for which medical examination will be required.

Assistance may be available with housing and removal expenses.

Applications, stating age, education, training, qualifications, experience, present and past appointments and salaries, together with the names of two referees, must reach the undersigned by Tuesday, 9th July, 1957.

R. F. BROOKS GRUNDY, General Manager.

Spencer House, Corby, Northants. 6719

BOROUGH OF EDMONTON

BOROUGH ARCHITECT'S DEPARTMENT ARCHITECTURAL ASSISTANT (temporary) required. Work includes interesting redevelopment schemes involving multi-storey flats and an industrial estate. Unique opportunity to gain valuable experience of unified control of building work in direct labour organisation responsible for all facets of building, with special regard to the integration of contemporary design with up-to-date mechanised building methods.

Candidates must be qualified A.R.I.B.A. Alternate Saturdays free. Appointment subject to satisfactory medical report.

Grade A.P.T. VI. £902-£941-£1,107, plus £10/£30 London weighting, according to age.

Applications must be made on forms obtainable from the Town Clerk, Town Hall, Edmonton, and be delivered by 5th July. 6741

INVERNESS COUNTY COUNCIL invite applications for the following superannuated appointments:—(a) CHIEF ARCHITECTURAL ASSISTANT, not less than 40 years of age. Salary: £1,200 per annum. (b) ASSISTANT ARCHITECT: Salary: £930-£1,005 per annum. (c) SENIOR PLANNING ASSISTANT. Salary: £875-£950 per annum. (d) DRAUGHTSMAN. Salary: according to age, £355 per annum at age 21, rising to maximum of £535 per annum. Applicants for (a) and (b) must be Associate Members of the Royal Institute of British Architects, and for (c) Associate Members of Town Planning Institute. Applications, stating age, training, qualifications and experience, with copies of recent testimonials, to County Clerk, County Buildings, Inverness, by 2nd July. 6742

CORPORATION OF LONDON

TWO ASSISTANT PLANNERS

in the

CIVIC DESIGN SECTION

of the

CITY PLANNING OFFICE.

primarily for assistance in design, detailing and modelling of redevelopment proposals for Barbican and other areas in the City of London. Ability to prepare perspectives in colour required for one post. Preference given to candidates with good architectural background and a sensitive and contemporary approach to design.

Salary: £589 7s. 6d. to £922 10s. in 10 increments; superannuation; medical examination.

Local Authority experience not essential. Point of entry on salary scale dependent on age and experience. Applications, with details of training, age, experience, present salary, and the names and addresses of two referees, to the City Planning Officer, 55/61, Moorgate, London, E.C.2, within 14 days of the date of this advertisement. 6743

COUNTY BOROUGH OF BARNSELY
BOROUGH ENGINEER AND SURVEYOR'S DEPARTMENT
APPOINTMENT OF JUNIOR ARCHITECTURAL ASSISTANT

Applications are invited for the above appointment on the temporary establishment at a salary in accordance with Grade A.P.T. I (£543 5s.—£625 5s. per annum). The point of entry into this Grade may be fixed above the minimum.

The post is suitable for a young man in his early architectural training, and offers a good opportunity for gaining further experience.

The appointment will be subject to (i) the Scheme of Conditions of Service for A.P.T.C. Staff; (ii) any other general conditions of employment operating within the Corporation from time to time; (iii) one month's notice on either side, and (iv) to a medical examination.

Applications, stating age, present and previous appointments, qualifications, experience, etc., together with the names of two persons for reference, should reach the Borough Engineer, Town Hall, Barnsley, by Friday, 12th July, 1957.

Canvassing will disqualify.

A. E. GILFILLAN, Town Clerk.

Town Hall, Barnsley. 6745

WILLENHALL URBAN DISTRICT COUNCIL

Applications are invited for the appointment of JUNIOR ARCHITECTURAL ASSISTANT, Grade A.P.T. I (£543 5s. to £625 5s. per annum). Applicants must have had experience in an architect's office, but not necessarily in local government. Appointment terminable by one month's notice on either side and subject to the National Scheme of Conditions of Service and Local Government Superannuation Acts.

Applications, stating age, qualifications, if any, experience and names and addresses of two referees, should reach the Clerk of the Council, Town Hall, Willenhall, Staffs., by 8th July, 1957. 6744

DERBYSHIRE COUNTY COUNCIL

COUNTY ARCHITECT'S DEPARTMENT Vacancies for ARCHITECTS. Salary range £707 5s. to £994 5s., on grades Special, IV and V of the National Joint Council A.P.T. scales.

These three grades are merged to provide a continuous progression to the maximum of Grade V, subject to satisfactory service. Commencing salaries in accordance with experience and qualifications. Pensionable posts. Canvassing disqualifies. Students at Architectural Schools who are taking Final Examination this year will be specially considered. Programme includes Schools, Ambulance, Fire and Police Stations and other interesting work.

Details and application forms from F. Hamer Crossley, Dipl.Arch.(Lpool), F.R.I.B.A., County Architect, County Offices, St. Mary's Gate, Derby. 6760

TO QUANTITY SURVEYORS VACANCIES occur in our "taking off" and "working up" sections, and applications are invited from Surveyors who have had a sound training and considerable practical experience, preferably in connection with large industrial buildings.

There may also be a vacancy for a Surveyor of particular initiative and administrative ability to co-ordinate the work as a whole and be responsible for estimating, adjudicating in settlement of accounts, etc.

Applications from first class Surveyors only can be considered and salaries will be negotiated according to qualifications and experience.

Applications will be treated in confidence and full particulars should be given to enable selections to be made for interviews.

E. R. Collier and Associates, Chartered Architects and Industrial Consulting Engineers, 70, Victoria Street, London, S.W.1. 6603

OLD-ESTABLISHED Mutual Life Assurance House wants a few men of initiative and integrity to act as Agents. Architects and Surveyors have the necessary knowledge and contacts to make business most profitable to us and them. Full details from Box 123.

Multi-storey housing at Regents Park

Architects: Davies and Arnold F.R.I.B.A.

REGENTS PARK DEVELOPMENT AREA 'C' undertaken by the Metropolitan Borough of St. Pancras comprises two hundred and twenty-two flats, twenty-five maisonettes and eight shops in multi-storey construction.

The scheme comprises three eleven-storey blocks of flats, one of eight storeys and two of five storeys, all of reinforced concrete and steel frame construction with cavity brick walls, together with three three-storey buildings in loadbearing brick. All buildings present an attractive elevation through the use of sandfaced, multi-golden wirecut facing bricks.
